Take trees for example. The branches of the trees could be freely scrollable in its own layer where there was nothing but sky, and thus no data to interfere. The trunks are very simple and repetetive, and so they could be easily merged and shifted through the playfield. Actually, the implementation is the reverse of this, since you'd take the character(s) for the trees and merge a copy of the playfield data into it. Another neat thing, is that you can move multiple trees with very little additional overhead. As long as the trees are on the same backround and pixel boundary, you can reuse the same character(s).

2883. Parallax scrolling

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-22 00:00:00 UTC
From: smrgoodw@reading.ac.uk
Message-ID: <43u2dd$620@susscsc1.rdg.ac.uk>
Source record: 88393

For those who might not have heard of the term, parallax scrolling refers to the effect that's exhibited in games like Moon Patrol, the Extirpator and, on the Mega Drive, Sonic. There are a number of scrolling backgrounds which overlay each other; those "furthest away" move more sluggishly to give the impression of perspective.

Sonic implements some wonderful parallax scrolling but I don't think it is an achievable goal on our humble 8-bit (well maybe a demo but not a fast-action game). I'm more interested in the basic parallax scrolling such as in Moon Patrol, where there are several "layers" which move slowly as you go up the screen. You have some mountains scrolling quickly in one layer, for example, and above are some other mountains scrolling more slowly, which appear to be further away.

I've been designing such a display on paper and I wonder if anybody has anything to say on the subject. The biggest difficulty I have found has been making two scroll zones adjacent.
The problem is that you need a DLI between them so that HSCROL can be set to the appropriate value. The reason this is a problem is that, as all good scrolling programmers know, you need LMS instructions on each scrolling line which forbids the use of a DLI. Hence the only solution I can see is to insert a blank scan line between the two zones and set the DLI on that. However (this gets better) if your (say) mountains are playfield 0 then a blank line will stand out as a black line between your scroll zones. The only way around this is to make your mountains out of the background colour (which should be set accordingly to the mountain colour) and make the "sky" playfield 0. Then the scroll zone meshes cleanly into the next across the scan line, no join is visible. Of course you have to do this with every zone to make sure joins are invisible; this means each DLI will be setting colours. The view will also look better with a wide playfield.

Any thoughts before I go ahead and code this?

There is a way to do it in a restrictive manner, that is with a periodic
background.
Use a character mode. The slowly moving background is composed of a given
character or an array of them. And each time you scroll, you redefine the
character so that it appears to scroll relatively. I mean, rotate the pixels
of your pattern in the direction of the scrolling. Don't forget that your
background characters will be scrolled with the rest of the display. So you
have to combine your scroll with the inerse of the scrolling of the rest of
the display.
This method is very fast as you only have to redefine chars and the display
will be automatically changed.
Is this clear?
This is of course possible only with character modes. Not bitmap. But there is
a similar trick with bitmap displays: keep several copies of your playfield
with the background pattern rotated in each copy. Each time you scroll, you
take display a different copy. But of course this costs you a lot of memory,
which makes it quite impractical on the 8-bit.
Does anybody have other ideas?

Bye.

Mega Magazine is now 'Free Ware'.

This means that it's legal to make copies for your friends, but you
may not ask any money for it.
User groups and other big distributors must first ask permission if
they want to add Mega Magazine to their public domain library. This
is because some distributors ask way to much for their public
domain and I don't like the idea of people making money from other
peoples hard work.

The main distribution is now handled by Mega Magazine itself.

The exact price for each issue is not yet determined, but it will
be a normal public domain price.
I will place a second message to state the exact price, but if you
are interested, you can always send me a message so I can inform you
personally whenever the price is determined.

I will also put Mega Magazine on the internet when enough people
are interested.

Issue #1..#7 are currently available.
The release date of future issues is unknown since new issues are
released when I got enough material to fill at least one disk
(double sided, enhanced density).

If you have any questions or maybe you want to contribute to issue
#8, please let me know!

#
#Sonic implements some wonderful parallax scrolling but I don't
#think it is an achievable goal on our humble 8-bit (well maybe
#a demo but not a fast-action game).

One of the Atari magazines (probably ANTIC) had an article on how to
do this and had a demo on the disk. It was three level depth as I
recall with the foreground moving quickly, the intermediate background
a little slower and the far background really slow. As I recall the
demo was someone walking along in a desert with mountains in the background.

As mentioned, I doubt that this method could be used in a really fast
action game, but a graphics adventure would be perfect for it.

Date: 1995-09-23 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <J9Dg2cr.ransom22@delphi.com>
Source record: 88282

Hi,

I just uploaded a program called Critters to atari.archive.umich.edu.
It is my first assembler program (other than the little programs you
do in order to learn a new language). It's also an exploration of
Artificial Life (A-Life, or AL).

I enclosed a small text file for documentation, but I imagine
you want to know a bit about it before you go through the trouble of
FTPing it. It uses a gr. 0 screen and a redefined character set to
create a "world" and beings to inhabit it. There are Critters (male
and female) and there are plants, and that is all that exists in this
world. Critters make decisions on what to do based on the world
around them, and on their own DNA. Plants don't make decisions - they
live, reproduce (if they aren't eaten first, and if the wind is
blowing in a direction that has empty space for the new plant to grow
in, etc.), and they die.

It's still a work-in-progress, so there isn't a lot of user controls.
The user can press OPTION to make some more plants, SELECT to make more
critters, or START to quit to DOS.

It works with Atari DOS and SpartDOS. It should work with MYDOS,
but I don't know for sure as I haven't tried that. It should run on
any Atari computer, as it is a tiny program (I'm very frugal when I
program - don't let the small size fool you:) - 1K of redefined character
data, and about 1.25K of program. It takes 7 bytes in page 0 for
data.
How did he do all that in such a small program, and with so
little data, you ask? Trade secret. Just kidding. I used the 8 bits
used for each character on the screen as the DNA. Each bit means
something significant. Thus, the screen display RAM itself is the data
area.

Anyway, it's up there if you want it. It's called CRITTER.ARC.
CRITTERS.ARC (note the S) is a mis-transfer: this is my first FTP "put",
and I screwed up and forgot to tell it it was binary that first time. So,
CRITTER.ARC is the binary upload, and it should work just fine.

Let me know what you think of it. But, remember it is a work-
in-progress. :)

-Joe

>has anything to say on the subject...

Just some random thoughts by an uninformed observer...

And to tie this thread with Mr. Binghams question about Page flipping/Way Out techniques...

I had always assumed that the method used in Way Out was an extreme form of what Mr. Goodwin calls
parallax scrolling. Without having ANY real knowlege of what's going on internally with any of these games,
perhaps Way Out indicates more is possible than you might think with our 8-bits. For those that haven't seen it,
Way Out is a full 3-D 1st person perspective maze game with completely smooth action. There was an ST game
that looked almost exactly like it which allowed multiple players connected throught the MIDI port (darn!, what
was it called?...it was one of the biggest ST games of all time). Obviously, Doom is its direct descendent.

Anyway, my assumption about how this was done was that each display line was DLI'ed to a separate scrolling
region with an executive routine doing scaling and such (which I imagine would simply set an increasing incre-
ment between scroll region pixels to pick up, compressing the data with "distance"). Of course, I don't know if
this is of any help to you, Mr. Goodwin, as Way Out was also an extreme example of a horizontally oriented
display, with each display line being at only one parallax level; no "region" changes required as a display line
was scanned. There is an impressive amount of other stuff happening in the Way Out display, but I imagine they
boil down to a few player/missles and other tricks. It also uses a less-than-full screen display window.

I've always considered Way Out to be an awesome achievement. Just wish it wasn't quite so darn hard to play!

Doesn't CMU's MACH-OS do distributed processing ?
Is that available for study ? You might want to take a look at it.
It is an interesting idea. Can the MACH-OS use anything besides
INTeL CPUs ? It would be neat if you could hang a dozen ATARI 8-bits
off of MACH-OS and have it use the 6502s for distributed processing.
That would be quite strange, actually. Hmm... I wonder if you could
network it in FORTH as a bunch of psuedo-controllers (as long as we
are dreaming...) ?

An X-Server for an ATARI 8-bit ? I would be happy linking in ANTIC
M-WINDOWS to an ATARI 8-bit 'C' compiler just to have pop-up windows
for error messages.

You want to know where everyone is ?

I would guess that they are:

o Registering for classes
o Buying their text books
o Signing up for their food service plan
o Moving into their new apartment
o Meeting their new roommate
o Signing their new building lease
o Trying to impress the boss after vacation

...there isn't a lot of time in the month of September to do your
own computer stuff!

Gee Bill, you shouldn't worry about the response. For anything you think
of, the more specific you are i.e. [multiplexed, GUI, spreadsheet, ...]
the narrower the interested audience will be. That's all you should read
into it. IMHO: When I was a chemist, I used spreadsheets daily, maybe
two hours a day with Lotus 123. Now that I'm out of that, I don't think
I've used a spreadsheet 2 hours in the last 7 years. The impact of this
is my need for a lot of computational power like you're talking about
is low. Once again, just my interests, but the only things I find interesting
are things like the '816 or maybe a good 80 column card.
Before anyone reinvents the wheel, there's a lot of relatively simple
hacks that could have/should have been done, but were never even tried.
For instance, MyDOS source code has been in the PD for years, but has
anybody tried to get it to run from under ROM or in banked memory?
I doubt it. How about something like hooking the BBK command line
DOS interface into MyDOS so it takes advantage of all the features
of MyDOS? The only thing I can guess is people are pretty happy with
things as they are. The only general topics of interest are things
like storage, video, interfaces, ... Where everybody would love
to get things like their stock 1050 reading 1.4 meg disks & 80
column ANSI color graphics comming out of their GTIAs.
Rick

Have also got a KXP-2180 dot matrix printer for sale. 80-column dot matrix, this printer can also support color with the addition of a color kit. Includes manual. Can be used for the atari (with 850 interface kit) or the IBM. Used this printer before buying my HP-540. Really liked it. will take the best offer. receiver pays shipping (about $5). Please note that 1 ribbon (in the printer) is included. replacements can be bought easily through most computer or office supply stores. Please note that I will also take trades for this equipment (I am really looking for a modem for my 8-bit atari with terminal software as well as any other software available for the 8-bit atari). This also applies to the previous printer ad as well. Thanks a lot!

2922. BASIC Programming Question

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-24 00:00:00 UTC
From: markg@alpha.wcoil.com
Message-ID: <443t9t$d26@ns.concourse.com>
Source record: 88294

I been using a program which I wrote for about a year now, but would like to add a feature to it, but can't figure out how to do it... The BASIC program allows our telephone reception girl to answer the phones during our talk-show (WIMA-AM Radio) and type in the Caller's Name, Caller's City , Male/Female , and Topic of Call... The output of the computer then feeds 2 monitors (TVs) in the studios, giving the Talk Host the information. The program also has the ability to "tally" the information, giving a weekly total of the information.

Now my question: The other evening, we suffered a power loss, and all the week's information was lost. I need to figure out how to save this information to my Indus Floppy Drive.. Either after each entry, or from the Main Menu....

The program is written on an Atari 130XE computer, using Sparta Dos 3.2.

At this point, all of the seperate information is being keep in Strings (NAME1$, NAME2$, CITY1$ etc....)

Thanks in advance for any help!

Mark

Hmmm. Is there a problem with using the SpartaDOS X internal ARC
command to archive programs? I arc'd and unarc'd it here before uploading
it, and it was fine. So, either SDX ARC is incompatible with the unarc
program you are using, or the files got transferred wrong.

Hmmm. I'll look into it and let you know.

First one to offer shipping + some Atari DISK games will get one
or both of these items. I don't want them, I don't have room for
them, and I want games.

Box 1: 2 850's, 2 power supplies, 2 i/o cables, 1 850<->printer
cable, 1 db25<->db25 cable. I don't know if they work,
nor do I have the time to test 'em. They are AS IS!

Box 2: 1 set of Atari 2600 Remote Control Joysticks. Yes, these
are complete with the box (with two prices still on them)
and docs. They look great, smell new, but are also untested.
They are AS IS.

Box 3: Docs. Dos listings, tech notes, etc. etc. etc. I don't
have time to do my own work let alone learn the tech specs
of the Atari. Probably half a foot of stuff.

Everything is AS IS. You pay shipping. You give me games.

And yes, if someone offers me a Gull-Wing Mercedes in trade for any
or all of these (heck, ALL my classic video stuff), they get it.
Otherwise, the bestest offer of disks gets the good(ies).

If no one wants this stuff, the Attic gets them. Mr. Attic does enjoy
melting things down here in Texas...

The simplest method of getting something from a variable to disk and
back is to just add a channel number to your print statements. For instance:

```
OPEN #3,8,0,"D:MYFILE.DAT"
...
INPUT NAME$
PRINT #3,NAME$
...
CLOSE #3
```

Now, if you want to keep track of several pieces of information for
several different callers, you really should be using arrays.
Unfortunately, plain Atari Basic doesn't support string arrays like
NAME$(COUNT) and CITY$(COUNT). The way you get around that in Atari Basic
is to subdivide a 'master' string into sections marked by byte offsets.
So let's say your string is called INFO$ and you decided each entry (for
each caller) is going to be 80 bytes long. Thus the first caller's
information is in INFO$(0,79) [bytes 0 thru 79] and the second caller's
information is in INFO$(80,159), etc. Then you divide each 80-byte segment
into smaller divisions for name, city, etc. Let's say the first 30 bytes
are the name, the next 25 bytes are for the city, and the last 25 bytes
are for the caller's topic. If the variable CALR held the caller number
whose info you wanted [starting at the number 1], you would reference it by:

```
NAME$=INFO$(CALR*80-80,CALR*80-51)
CITY$=INFO$(CALR*80-50,CALR*80-26)
TPIC$=INFO$(CALR*80-25,CALR*80-1)
```

Once you have all of the information stored a single big string, you
can write/read it to/from disk with a single PRINT/INPUT statement as
demonstrated above.

Hope this gets you started on the right track.

Source record: 88304

Okay, I just did several things, and I am now at a loss for
transferring Critters.

I downloaded the version at the atari.archive, and found that it
was, indeed, garbled.
So, I uploaded the straight critters.com file, and then downloaded
that, and found that 1) it is 1/2 again as large as the file I uploaded, and
2) it doesn't work.

So, how the heck does one get a file to an FTP site without having
it screwed up? I've /received/ files from FTP before with no problems.
Getting them there, however, seems to be another matter entirely.

What I did to transfer the files, in all cases, was to set the
mode to binary, then "put filename.ext filename.ext". Is there anything
wrong with what I am doing?

ARRGHH!

I have no idea who to tell at the atari site that critter*.* are
bad files,and should be deleted.

There's a MUCh better game by DataQ that lets you have about 8 players all playing simultaneously via I/O cables networked together. Can't remember the name right now...

: can someone tell me what the specs are for the 800xl power supply??

There are several variations of the XL power supply but here are the
specs for the one I use:

Atari Part #: CO 61982
Power Supply DV-512CM DVE
Input: 120V AC 60Hz 40 Watt
Output: +5V DC 1.5A

Pins 4, 1, and 6 are +5V

Pins 5, 3, and 7 are GND

Male end pin breakout from power supply

REALLY?! I need to see this! :) Ever since I put 2 and 2 together
(GameLink2 and Capture The Flag), I've wanted to see a game like this.

Well, of course, there's Maze of Agdagon, but it's 3D isn't as neat as
Capt. Flag or WayOut's... of course, it IS better than many standard 90degree
3D games though (mainly because of the cool HScrolling idea :))

What we NEED is Descent-XL! :) :) :)

E-mail it, UUencoded, to ME! :) I'll put it up on UMich for you! :)

Also, are you sure you're transfering it from your COMPUTER to the UNIX
BOX properly? (ie, from home, to the computer with which you're FTPing..
don't just worry about the FTPing computer and the FTP site...)

Try unARCing it after you upload it and before you FTP it up..

> What I did to transfer the files, in all cases, was to set the
>mode to binary, then "put filename.ext filename.ext". Is there anything
>wrong with what I am doing?

I usually just go "put filename.ext" - dunno what's wrong with how you do
it.

> I have no idea who to tell at the atari site that critter*.* are
>bad files,and should be deleted.

Jody Lenn is the guy.. you could of course UL some text file saying:
"DONT DOWNLOAD CRITTER.ARC, CRITTERS.ARC, etc."..

I often UL a file named: "filename.ext.DONT.DL.BAD.VERSION" so that they'll
see it right next to the original, screwed up "filename.ext".

I don't mean to get you down, but you are charging way too much. most people in this world don't want this stuff, that is why they sell it to us for such good prices (or sometimes even give it to us.) I know you have invested a lot of money for this stuff, we have too. If you want to get rid of it and make a profit, sell it for less and at least make something. If not, then just use the stuff and get the most out of it. I don't want you to get angry at me, I just thought I would tell you my opinion.

>
>We don't want to just throw this stuff away, but aren't sure if they're
>worth anything or if anyone would be interested.

They're worth something. Especially the 800 and 850 and games. 410's aren't
really worth much if anything, and 810's aren't the #1 choice for drives,
but I'm sure you'll get at least $15-25 for it.. at least.

>What whould be you're advice...try and sell it all at once, or piecemeal,
>or even try and sell it at all? Any suggestions?

Don't try and sell it all at once unless it's an insanely low price..
most people don't need EVERYTHING in a system.. I know if I were dealing
with you, I'd be interested in the 850 and some games (not ALL of them, I'm
sure).

Oh.. forgot the books. Books are always good. :)

Good luck!

I am posting this message for a friend who does not have Internet access.
If you send me e-mail, I will make sure he receives it. -- Basil
------------------------------cut here-----------------------------------
ATARI ST/8-BIT

ALL SOFTWARE PACKAGES ARE ORIGINALS WITH COMPLETE DOCS, DISKS, AND
BOXES, unless noted with a * which means there is no box. I will refund
your money on any disks or cartridges that do not work.

Best offer applies to all

Atari ST 3.5" software:
E-Z Track MIDI Sequencer (new, unopened).....$6
Personal Pascal *.....$4
ST Key *.....$4

Atari 8-bit 5.25" software:
Atariwriter (cartridge) (new, unopened).....$6
Atariwriter (cartridge) *.....$4
Atariwriter Plus (cartridge) *.....$4
Basic XL (cartridge) *.....$4
Pilot language (cartridge).....$4
Telelink (cartridge).....$4
Turtle Tracks.....$4

I only have an 8-bit Atari. I would also trade for various games, such as
Clowns & Balloons and Spelunker.

The above prices do not include shipping.

Except for trades, minimum purchase is $12 worth for Atari items. The
shipping cost depends on how many items you want, if they have boxes, and
how heavy they are. For items that can be sent with the standard 2 lb. US
mail book rate, shipping is $3. For everything else, I will weigh the
items and call UPS to get a shipping cost for you. I will only ship within
the continental UNITED STATES. No exceptions.

Very few prices are set in stone. The more you buy or the more you
have to trade, the more interested I will be in making the transaction
worthwhile for both of us.

Thank you,
Randall

If you have other computers, I have items for sale or trade for the
following (in order of most stuff to least stuff available):

o Commodore 64 software, hardware, magazines, and books
o IBM software
o Macintosh software (mostly old B&W games)
o TI-99/4A cartridges
o Amiga software and books
o Atari ST and 8-bit software

Check out these lists at my friend's URL -> http://www.rain.org/~basil
------------------------------cut here-------------------------------------
Please send any e-mail to basil@rain.org and include at the top of the
message or in the subject header: "Forward to Randall".

Make an offer for the items below. Will also gladly trade it
all for a nice working Vectrex. =^)

Commodore plus/4
with power supply, works.

Atari 400
with power supply. Has problems (freezes up.)

Atari 2600a ("Darth Vader" black front panel)
Brand spankin' new condition, however there's no sound (TV
sound comes out instead) no power supply, no controllers,
no games, but includes the box! =^)

Atari Power Supply: CO616636
trade for one that will power an Indus GT Disk Drive?

I think it's a bit presumptuous of you to assume that just because you
thought of an idea everyone should automatically be interested. If
you post an idea and get no response, your question of general interest
has been answered. That is what happened here.

Incidently, a Bay Technologies 8-port serial multiplexor with a maximum
throughput of 9600 bps can be had for between $600 and $800. The
price depends on quantity, etc. The Bay Tech MUX is nice because it
has 6 different multiplexing modes built in -- the primary disadvantage is
that 9600 ain't very quick.

I don't think you're all that correct, actually.. If WayOut (which I only barely remember from the C=64 version my brother had years ago) is truly like Capture the Flag, then here's what I think..

(and if not, at least this is how I think Capt. Flag does it! :))

The screen is split in half, a la Alternate Reality. Forces simple shapes (rectangles, squares, circles; no triangles unless they're pointing left/right) but speeds up the display very quickly..

Only the top half of the image is drawn, and then via DL re-load instructions, it is mirrored below itself. (In Capt. Flag, you get the feeling of being short, compared to the walls, instead of about 1/2 the height of the wall, because the top half is in a larger (vertically) pixel mode than the bottom half).

When you swing (rotate) left/right, the walls bend in arcs... I feel that all that was really done was a bunch of positions (degrees for each arc) were pre-calculated for each depth (distance) they could be. (speed speed speed)

It really truly is 3D animation, just of a very limited kind.. very cool. :) Now, if they could (easily) texture-map some images on these TRUE 3D walls (like Alt. Real. does with flat wall faces) and still do it FAST! :)

Do I hear Sweet 16 DOOM XL ??? :) (Well, ok Wolf. 3D because it doesn't do "look up/down" and different heights.. but still, EVENTUALLY it could be done, I think! :) (maybe losing the texture-mapping..)

SOMEBODY >DO IT!<

2946. Seeking "Watchmaker" software

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-25 00:00:00 UTC
From: aa128@detroit.freenet.org
Message-ID: <446jlt$h6v@detroit.freenet.org>
Source record: 88318

Hello,

My friend and co-worker tells me of a program written for his Commodore 128 called Watchmaker. I am wondering if anyone knows of an Atari 8-bit equivalent. Here are the particulars:

Title: The Blind Watchmaker I: Biomorph
Copyright 1991
(Based on a concept by Richard Dawkins, Copyright 1986)
Author / Programmer: Dov Sherman
Author Address: ASU Box 14380
Boone, NC 28608-0001
Site: ftp.funet.fi

Basically, the program begins with a graphic figure and "mates" it with another graphic figure to produce a number of various "offspring" exhibiting different inherited characterisics of each of the parents as predicted by classic Darwinian theory.

Does this sound familiar to anyone?

Thank you in advance.

-- Doug

That was it! Maze of Agdagon! I think the newest ver. has docs on teh
pinouts to make the network cable. Either that or the registered ver. has
it ..not sure.

Greetings, Atarians!
I do not subscribe to this newsgroup. I am posting this for a
fellow Atarian, and if I have violated protocols of this group, or
made your day worse in any way, direct your flamethrower at:
tderrick@acpu.com
For sale: Atari 8 bit hardware and software
1200XL, cover, manual, no power supply
800XL, manual
Atari Touch Tablet
1050 Disk Drive, cover, manual
1027 Daisy Wheel Printer, in box, manual, spare ink roller
2 Joysticks (wico bat handle, "boss")
2 serial cables

Indus GT Productivity Software
GT Albert E. Spread Sheet
GT Estate Word Processor
GT Data Manager (no manual)
System master diskette DOS XL

Cartridge games:
Computer War
Ms. PacMan
ChopLifter!
Atari Artist
Galaxian
Star Raiders
Dig Dug

Disks:
Home Filing Manager
Family Cash Flow
Colossus Chess 3.0
Smart DOS
Disk Wiz II
about 30 games (copied, I think)

To the best of her knowledge, everything works. She and her husband
and kids have decided to make the Gatesmeister richer, and have no
further use for these. She would like to sell all in a package, but
any offers will be considered. We suggest $100 for all, but will
consider any offer.
As I am not very knowledgeable about 8 bit prices, it will hardly do
much good to send flames. On the other hand, useful info will be
welcomed.

I am the editor of the Atari Boise User Group newsletter. I would
like to help this person find a good home for these units. Send
offers to:

2950. Laughable prices on hardware

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-25 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950925001341.9007A-100000@PEAK.ORG>
Source record: 88322

I'm going to have to agree with another poster who voiced his opinion on the ridiculous prices people are asking for 8-bit hardware on this newsgroup. Sure, it's none of my business what they charge or actually take in, but having just GIVEN AWAY TONS of 8-bit stuff for FREE, I feel compelled to comment.

I just got back from a summer back home at the house in Alaska. Up there, the 8-bit scene died eons before it even regressed elsewhere. I am SURE I had the largest collection of 8-bit stuff in that state (no big claim, mind you, but a TON of stuff).

I had several 800XLs, 1200XL, 800, 5-6 1050s, 2 1050s w/doublers, 2 Indus GTs, 5-6 850's, HUNDREDS of floppies (never went threw them all), at least one Happy 1050, probably a HUNDRED original games with docs, an almost COMPLETE set of Antic with disks, almost complete set of Analog magazine, other magazines, technical reference manuals on probably EVERY piece of 8-bit hardware, most of the books ever printed for the 8-bit (many copies of De Re Atari, etc, and even hard-to find titles like Atari Roots, etc - far too many to mention - probably 75 books), joysticks of all genres, diagnostic stuff like a 130XE ECI/cart slot deal with lights on it to diagnose the computer (don't even know how to use it). I had a little nut&bolt chest chock full of 8-bit innards all labled (sent to Bob Woolley for free). I sent out some 850s last year for free - just asked for postage.

Anyway, I had to get rid of the stuff because it took most of an entire small room in the house to store it. I used a cargo van to deliver it, and the vehicle was thorougly loaded. I gave it all away for FREE because it wasn't worth ANYTHING to people up there and I had to get it out of the dad's house. At the prices I see things for sale here for, I feel like the biggest fool - could have gotten hundreds or a thousand dollars!!! NOT!!!!! I'm just glad the stuff went to someone who knows and appreciates 8-bit Atari stuff, and I am sorry that circumstances don't permit me to keep my collection.

I understand that stuff like a good-working ATR-8000 or MIO or Black Box may bring a premium, but not stuff that others (including myself) have given away free, by the truckload.

Sheesh! Do yourself a favor and some needy Atarian and when pricing your stuff, remember that the cost of MAILING the stuff most likely exceeds its value.

my $.02.

Nope, that can't be. Inverted characters are generated by the ANTIC chip.
The ROM character generator only contains the first 128 characters.

I would say your ANTIC got some thermical problem. Probably it would
be a good idea to spend it a cooling-cap (made of aluminum and attached
with some of this white greasy stuff you can buy at electronic part shops).
Hope you understand what i mean... My technical english is somewhat poor.

Message-ID: <445b02$raa@news00.btx.dtag.de>
Source record: 88327

Hello out there,
i'm still working on the Atari800(XL) emulator that shall
be released to the public domain soon.
Now, the last thing i'd like to do was to make the format
commands work correct on virtual disk images.
It's okay with disc formats for which the floppy drive
return less (or equal) one sector of the "bad sector bitmap"
after the format command.
But what about formats like 80/DS/SD which has
80*2*18 bits -> 360 bytes of bad sector list?
Is this data returned in multiple sector answers (each
aligned to the sector length 128/256 byte)? In one
chunk? If so, does every block start with 'C' for completed?
Currently the emulated DOS dies.. I guess, it's
buffer is overrun or it is waiting for some different
format of data. Could you help me out of this?

Thanks!
Juergen (german atari freak :-)

This CLOWN Ortman has been showing up on the Pro! network off and on for the last few years with his off the wall "ORIGINAL COST" posts! We chased him off of the Pro! network and now he shows up here......arrhhhh!

When people do not give him his fantasy prices, he becomes verbally abusive to the Atari 8-bit community. Sounds to me like this guy got stuck with a lot of Atari 8 equipment and STILL insists he will get his money out of it......tough I say. We all have machines that depreciate. I have corresponded with one person who personally told me he stopped calling the Carina net specifically because of Terry Ortman.

Interesting! About 10 years ago (circa '84-85), Me Ortman used to peddle
what appeared to be bootleg copies of the Forem BBS program theu his Starfleet
BBS ($60.00 for Forem 1030?! Sheesh!!) From what I can tell, he has made
plenty of money off of the 8-bits over the years. Why he continues to think
that it's 1984 again is truly puzzling!

From: F Tooned <ftooned@delphi.com>
Message-ID: <BHNB2ZB.ftooned@delphi.com>
Source record: 88338

Hi All,

Just got back from being "on the road" for about a month. I had just installed a Novell File Server here at the office before leaving, when I discovered some serious hard drive problems on my notebook. All of my data was transferred over to the server, and in bringing the data back over I neglected to transfer my telecommunications software...

Imagine my suprise when I wanted to get on the networks a week or two later. (what a drag!) I've missed about three weeks of messages, and in finding out there have been a few SDX ROMS that haven't managed to work properly, I hope that I haven't been flamed too bad. I will say that some of the SDX ROMS did "work", and I'm still not too sure what happened. None of the checks recieved recieved for orders have been cashed yet, and it will be "very simple" to get working ROMS out now that I'm aware of the problem.

I trust that the majority of you out there have recieved a pseudo-catalog in the mail by now, and hopefully caught the part about having to travel "extensively" through October. In fact, I'll be back on the road in a couple of days to get the MARS 8 through the final production stages.

This time I'll take the much-needed telecommunications software, and will be able to communicate via E-Mail more promptly. The MARS 8 is almost finished, and work on the MIO II is being done concurrently in order to insure compatibility. If I'm having some problems with a simple ROM, imagine what could possibly happen if the extra time and testing needed for the MARS 8 and MIO II was overlooked. FTe is back to "full time" operation status, and believe me... the MARS 8 and MIO II are gonna work flawlessly! The finished catalog and phone support will be reactivated sometime around November or December, so hang in there another couple months... Again, I'll be on-the-road through (possibly) mid-November, but will be able to communicate via E-Mail when I'm not in Arizona.

Thanks, Mike

Why it's "Maze of Agdagon" (or just Agdagon). It's in the umich archive.

BTW, I'm reasonably sure "Way Out" and "Capture the Flag" did *not* use
hardware scrolling to accomplish their 3-D first person views.

JW> Hmmm. I'll look into it and let you know.

I've seen this problem occur before with the SDX internal ARC command, but
on the un-ARCing end. Certain .ARC's when un-ARC'ed with SuperUnARC give the
bad header message while unARCing with the build in SDX ARC will not. I've
usually had luck in unARCing the files anyway, but it is annoying.

Just turn on the computer. You should get a READY prompt.
type this:

? FRE(0) <RET>

If the answer is 37902 then you have 64K.
If the answer is 13326 then you have 16K.

I know the numbers may not add up, but they are right.

>SOMEBODY >DO IT!<

Wolf 3D wouldn't be out of the question, and I hear it's been done on the Apple IIgs (a 65816 system). The bad part, is that the algorithm plots one column of pixels from the top of the screen to the bottom, before continuing to the next column. This works out great for the one-byte-per-pixel modes of a 256 color display, but it would add a lot of overhead to have to mask in each pixel on the Atari8.

I think you'd want to try and write it one byte at a time, which would make things really fast, but you'd really have some resolution problems by having only 40 columns across. You would still have texturing within each byte of course, so it might not be _that_ bad, but you've got some work to do to get rid of potentially ugly staircasing on diagonal wall boundaries. You might be able to mix in some pixel level merging at the wall boundaries, but I don't know if that's feasible. I haven't really thought about it very much, but it would be fun to try if I had time.

Yes, but this address is unused by all DOSs I know of. When DOSs adjust sector size they do not manipulate this address, and I have manipulated this address and then done XIO calls to initialize to try to coax different sector size and failed.

BTW, you may think DOS3 uses 1K sectors but it is actually a block of several 128K sectors treated as one unit.

: A yes, the above only goes for hard drives. Floppy drives connected to the
: BlackBox use 36 sectors per track in High Density.

This may be semantical since the end result is you get to max out your floppies even up to 1.44 megs.

The most pressing problem regarding drives with larger byte per sector sizes are CD-ROMs.

BTW, the Black Box merely allows the HD to look like 256 bytes per sector. No DOS that I know of has managed to pull 512K or 1K bytes per sector for real.

If you have 16k the upgrade to 64k is trivial. Drop me a line at
bjcorr@delphi.com for details.
Oh, and from basic try a PRINT FRE(0) to get an idea of memory size. I believe
that 64k shows about 32k free with basic loaded.

The mortal James Finnegan wrote:

: The A800 VLSI hardware guys include:
: Jay Miner - Creator and System architect, VSLI manager
: Steve Mayer - Also one of the creators (from the grass valley group)
: Joe Decuir - Antic and system and creator
: A french guy (whose name I forget) - Antic logic designer
: George McLeod - CTIA and GTIA logic design
: Doug Neubauer - Pokey logic design
: Mark Shieu - Pokey chip design
: Steve Stone - Pokey layout design
: Steve Smith - Technician for antic and gtia
: Delwin Pearson - Technician for Pokey

Out of all of these it appears as if Doug is the only one who went on to program software for this machine, and the only one to keep interested in Atari's 8-bit machines well into the 80s (i.e. his 2600 games). His interest in the 2600 probably means he helped with that design too.

Jay Miner moved on to other projects rather quickly after finishing the 400/800 and never seemed to look back. He was amazingly ignorant about programs like MAC/65 which first appeared as early as 1983 when asked about the 8-bit in a C= Amiga conference on Delphi.

Jay is an icon which I and others have conveniently affixed the legacy of custom A/V hardware but in reality it is the team of people who shared his ideas who deserve the credit.

I don't think the Lynx, for instance, had any direct involvement from Jay but was rather designed by some of the disciples. The same thing with the SNES.

Radio Shack doesn't but almost ANY other electronics store should. As we all know, lately Radio Shack has been hardly interested in carrying the electronics parts that made them famous, Ask for a mini-DIN 8 at any other reputable electronics store and they should get what you need.

>Anyone know where I can get such a beast? The Apple Macintosh 8 pin plug
>is much smaller than the one that radio shack had, and they did have a 6
>pin that was close, but I believe that is for PC compatible keyboards.
>

Actually, the 6-pin mini-DIN is also used for ADB (Apple Desktop Bus) devices like your keyboard and mouse (assuming your Mac is an SE or better). PC keyboards and mice have, in their quest to APPEAR more Mac-like, adopted the same smaller connectors but they still lack the sophistication of Apple's ADB (which allows many, many input devices to be hooked up at once) as they rely on dedicated ports for every device.

Hope this helps...

I'm pretty sure that it's available and that it is designed to be
portable. (The forthcoming (vaporware?) GNU kernel is based on Mach.)

I'm taking an OS class right now, and Mach is one of the OS's the book
talks about in depth. So in a few weeks I should be able to say more
about it.
In that class, I'm constantly thinking, "Could this be done on a
6502?"

2987. Floyy Board by CSS

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-27 00:00:00 UTC
From: moellerw@hookup.net
Message-ID: <44c87f$f1a@noc.tor.hookup.net>
Source record: 88354

Hello Classic Atarians!

I just wanted to tell everyone here my experiences with the Floppy Board add on for the Black Box by CSS, adn want to compare notes with other Floppy board owners.

From the first moment that I ordered a Black box with floppy board from CSS I have had trouble. The first trouble was getting the thing to work with upgraded machines. It would NAK out on me during copies. I complained to CSS and they claimed it was my computer....probably the CPU.....well, I changed the upgrade to a stock computer that did work flawlessly with the BB/FB and the problems showed up in THAT computer. Well, I have a ton of 8 bits, so eventually I kept swapping and swapping CPUs until I did find one that worked. Now, I had an Upgraded 256k 800xl running a hard disk, 1.4 meg floppy 2 360k floppies, a printer and a modem. Almost the ultimate system eh? Well, I picked up a sweet 16 and the thing did not work (the only one of all that were made up until now).....well, I finally got around to getting it exchanged and it arrived in the mail.....I promptly put it in the machine.......NOTHING.....green screen.....so, I unplugged the BB/FB and presto!....it worked.....played Centipede too.....so, I went to the BBS, and plugged it into the floppy board there.....nothing....would not boot....so, I put my stock machine back on line (the only thing I can get to work reliably with the BB/FB combo....so, I got my 3rd Black box...the one sans Floppy board....plugged it in....and it worked!

I have had machines that would not work with an MIO, and the Black box...I have always been told it was the CPU by Bob Puff, and if I swapped enough of them in, yes, they would finally work..but, this Floppy board is another story....I figured that this 16 bit Sweet 16 would be a top notch chip and not "marginal"...which is the reason I was given by MR. Puff that certain computers would not work with the BB.....has any one else suffered these problems? I wanted to assemble the ultimate 8 bit system for my use....but it seems I can either have upgraded machines or 1.4 meg floppies with the floppy board but not both.....

Really frustrated

Graphics 9 mode (or another GTIA mode) would be ok.. blocky, as you say,
but not bad.

Make it quicker by making the pixels even squarer (the display list would
simply redisplay the same line a few times, then the next line a few times,
etc.)

Message-ID: <A525CC1567@east-01.novell.leeds.ac.uk>
Source record: 88161

The game Shadow of the Beast which was/is famous on the Am**a
and (ST?) reputadly had 11 (or thereabouts) levels of parallax
scrolling. It was a horizontally scrolling platform type of game.

Anyway several years ago this game was due to be released for the
Atari 8-bits but it never quite made it. I have seen a demo copy,
nowhere near to a full game, just the background moving and the main
character in motion and it had several levels of parallax scrolling.
I'm not sure how many, probably not 11, but it looked pretty good.
My point, well, it can be done so hopefully somebody will produce a
full game that uses the effect.

Richard Gore
chmrig@leeds.ac.uk

PS If anybody has a spare ten grand (UK pounds) I might be able to
get them the rights to the Atari 8-bit version of Shadow of the
Beast!! No I'm not joking, that was the last price I heard the
copyright holder wanted for it, and the game wasn't even finished -
you would have to do that yourself!!!!!!!!!!

OK, so I've read the FAQ - and I know there were some hard drives made for the 8bits, the use of the Black Box, etc. Unfortunately, it looks like you need an XL for the Black Box, and those old drives have bit the dust.

Anyone know of a way to connect an 800 (sorry no XL) to a hard drive (SCUSI) directly?

We're not talking using an IBM via SIO2PC either...

I was afraid somebody would say that...
I have it, and spent a lot of time reading it last night. I actually
got started writing the tokenize (edit/precompile) and detokenize
(LIST) routines in C. But it isn't very clear on exactly what the
tokens are for each command, and I haven't gotten to the chapter on
SAVE yet to see how well it explains that.

I know I've seen articles on the subject, but now I can't remember
where.

I can't answer the first question (although I'd be curious why you'd want to go from disk to tape :-) but I can answer the second.

There was a program way back in an old issue of Analog (Issue 27 comes to mind) called MicroDOS XL. This was a boot program only a few sectors long which replaced DOS and listed the directory contents to the screen. You could then scroll through the directory using either the SELECT/OPTION keys or a joystick. If I remember correctly, the program only offered support for SS/SD drives (maybe dual density, I'm not sure). At the time, I had only a Percom RFD44S1 drive (DS/DD) so I modified the program to support the full 1440 sectors you get with a DS/DD disk. Although there were a few files the loader couldn't handle (due to the fact the program could only access raw sectors and not filenames) it performed admirably, and I still have a bunch of disks today which use MicroDOS.

The ANALOG issue contains the assembly source code for the program. I've probably still got the source for my upgrade to access 360k disks and if there's enough interest I could upload it to umich or it might even be short enough to uuencode and post here.

Source record: 88169

Perhaps this is an obvious question, but did the Atari 8-bits have an 8-bit external data path to system memory and other components? I know the internal registers were 8-bit, but I'm not sure about the external data bus width. What about the coprocs like GTIA, ANTIC, etc. -- were they 8-bits internally also?

Thanks

>superior 5200 version ever officially released for the 8-bits?

No, the 5200 version was not released on the 8-bits.

I have the Space Invaders cart by Atari, and the Deluxe Invaders cart by Roklan. I also have an interesting hacked invaders game on disk. It _looks_ like Roklan's Deluxe Invaders, but it has the _sounds_ of Atari's Space Invaders. I always wondered if the two cartridges had a common development history, and this version I have was "leaked" somewhere in between the two releases.

Either that, or someone simply hacked the two together for the heck of it.

Has anyone else ever seen this other version that I have?

2999. Help ST Xform F:Device

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-28 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DFLtx3.12H@ridgecrest.ca.us>
Source record: 88171

I just purchased ST Xformer V 2.5. I am running it on a
Mega2ST from a HD connected by a Link. The X-Former cable
is connected to a 1050 floppy. I wish to transfer files
from the ST's floppy to the 1050 floppy for use on a
800 and 130. X-Former is using DOS 2.5. I have tried
using F:Device to read and load the a:*.* directory
within X-Former, but I get no response. The same for
F:C:*.*. Also, the Quick transfer utility dosen't seem
to work. In the X-Former 3.0 docs, Derrik say's this is
buggy at times. V3.0 on the Mega is worse yet.
So, for now, I run PC X-Former XF252.exe and
use the dos25.xfe command to load dos as D1 and a
pc disk file as a virtual file D2. I copy the file
from D2 to D1. The file is then enclosed in the virtual
dos25.xfe file. (I haven't been able to load more than
one file at a time, an Mydos dosen't seen to be able to
do this, although I read that it can handle 8 files.)
Then I copy to a 720K floppy, go to the Mega, have X-
Former read the dos25.xfe file and then I am able to
save to the 1050.
I would like to get this set up so my 12 year old can
transfer the files, but it's a little complicated doing
it this way. What are the alternatives for my current
set-up. I don't want more cables or boxes and would like
to do this on my Mega or 1040 (Falcon under Backwards?).
I can FTP any recommended software.

Thanks for any advice

Mike

I don't believe Berserk was ever liscensed for porting to the 8-bit Atari,
but I always thought of K-Razy Shootout (CBS) as great Berserk clone.

I'm afraid K-Razy Shootout may not be easy to find either, but most titles
are available if you look hard enough..

3001. SpartaDOS X Start Address?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-28 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <pDNCeRQ.ransom22@delphi.com>
Source record: 88173

Hi,

In programming Critters, I've gotten more and more tired of
switching to Atari DOS in order to save the CRITTERS.OBJ file with a
start address as CRITTERS.COM. Isn't there any way to do this from
SDX?
I looked in the manual, but although it has the LOAD and SAVE
commands, save does not offer an option of telling it the start address.
It is getting to be a real bother to switch back and forth during
the development of this program. Surely there is another way!

Thanks in advance for assistance.

GTIA is still not one byte per pixel. If you draw one full byte, you'll
get two GTIA pixels which cuts an already low resolution in half.

You're right that GTIA is the right mode to do it in though.

Whilst reading the usual rubbish I find here, ext287 wrote something
interesting to All about HD for Atari 800:

Hi ext287,

e> Anyone know of a way to connect an 800 (sorry no XL) to a hard drive
e> (SCUSI) directly?

One of the best kept secrets of the 800 was the fact that there was an
expansion port. Take it out of the casing, and you'll find an edge connector
at the back of the main PCB. As for what the layout of the connector is, I
couldn't say. I'm sure, though, somebody will know.

Yes! I don't have Solaris yet, but am really looking forward to it (from all of the things I've heard here, I'm salivating). Here's Doug's exact quote (which was essentially paraphrased in my last msg...)

"
I actually did most of Solaris back in the '82 to '83 time frame, but when I finished it was after the "crash." An interesting story, was that I had almost sold it to Atari (and Atari flew me down to LA to see a preview of the movie "Last Star Fighter", that they were going to use as a "movie tie-in" or something.) and then over the week-end the Tramiels bought Atari from Warner, layed everyone off, and put all game stuff on hold. So the game sat on the shelf until mid 1985 or so, then Atari called out of the blue. They had decided to sell 2600 games again and someone remembered that I had a game. So I added a few more features to it (improved the charts I think?) and it went on the market finally in 1986 (I think)

Actually I have another "Space" game that I did for the old 8 bit Nintendo (NES), that once again I finished too late for the market, so it sits on the shelf. (I don't expect to get a call from Nintendo however :-)
"

It would have been *amazing* if it was released in the '83-'84 time-frame though! Maybe it could have puuled Atari's fat out of the fire... Given Doug's experience in IC design, it wouldn't suprise me if the cart was loaded with more chips than the 2600 itself. He never did tell me whether the cart was "souped-up" or not, though :-(

I don't know, but having both isn't a bad idea. I have a complete
system in the bedroom, but I also keep an 800 and one 1050 hooked
into our living room TV for those little incompatibilities.

It's not like they're horribly expensive, either.

Why not? There are probably lots of people just wait waiting to sell you
an old 286 PC (or even a 386/486) real cheap, so cheap you could use it
just as a disk server...

There was also the Corvus system. It used a modified OS, and the
drive connected to the joystick ports. Frank Seipel
<fseipel@freenet.columbus.oh.us> used to use some 10 or 20 meg
Corvuses on his BBS's. They're not standard drives, though.

Bernie Rataj <brat@interlog.com> wrote:
>So what is it you really wish to accomplish with all this, if I may
>be so bold...?

Oh, I have a few ideas in mind.

The most basic is this: I'd like to be able to get a listing of a
.BAS file without BASIC -- or even without the Atari.
(I'd also like to do the same with MAC/65 eventually.)

In addition, I think it would be cool to write an almost-Atari BASIC
interpreter portable other systems. I'd leave out a lot (graphics,
sound, etc. -- for that you should go to an emulator), but the core
should be there.
I'd like to be able to write a program like this in Unix:

```
#!/usr/local/bin/abasic
5 REM ** A Simple Atari BASIC program **
10 DIM A$(5),B$(5),C$(11)
20 A$="hello":B$="world"
25 REM it's been a while since I did Atari Basic string manipulation...
30 C$=A$:C$(LEN(C$)+1)=" ":C$(LEN(C$)+1)=B$
40 ? C$
```

It might be useful for some simple general purpose programs we might
have lying around somewhere.

I'd probably want to add some of the extras offered by BXL/BXE and
Turbobasic, too.

It's possible to sort-of-almost-not-quite do this with David Firth's
Atari emulator for Unix, but it only runs BASIC as just another 6502
program, while I'm skipping the 6502 part, hopefully making the
programs much faster, at the expense of some loss of functionality. I
hope to be able to put some of that functionality in (e.g. catch
specific PEEKs and POKEs, and make the right thing happen) after I
have the core working.

BTW, It might be cool to do the same with Action at some point too,
but I probably won't.

There are quite a few disassemblers for the atari. Some <Antic?> can work from a disk file or memory. For that matter, if you have something as simple as a ED/ASM cart you can load the file into memory & use the built in debug program to disassemble the program. I've never used a "write disassembly to disk" or whatever the feature would be called. Worst case I've had is dumping the listing to printer & just patching what I needed to in the original file. It would help if you could be a little more specific about what you hope to accomplish. For instance, if all you need to do is look at the source & patch a byte or two, I think you can pick up an ED/ASM cart for about $5. A lot of the info you will get from a simple disassembly will be hard to interpret without knowing what the hardware is. For instance, you'll get stuff like STA $1000. Without a schematic you won't know, without a fair amount of gymnastics, is $1000 [RAM, LED, speaker, keypad scan, ...].

From: caroul@murray.fordham.edu
Message-ID: <1995Sep29.141132@murray.fordham.edu>
Source record: 88191

Greetings.

This could be a long shot, but I was wondering if anyone owned the game "The Guild of Thieves". Like the other game by that company, "The Pawn", it comes with a storybook which serves the purpose to make life miserable for those who have bootleg copies of the disk and not the book. In the game, periodically, they ask a question like, "what is the third word in the second column on page 45?" If you can't answer it, they switch you off. I own both games, but I do lost the booklet to "Guild of Thieves" and I can't play it.

If I sent money ahead of time, would somebody be willing to photocopy the book for me? To my knowledge, Rainbird software no longer exists.

Please e-mail responses. Thank you.

Marc Caroul

j >I am looking for documentation from Software Automatic Mouth, also known
j >as S.A.M. for the Atari 8-bit computers. Specifically, I seek the list
j >of phonemes that is included with the docs (as I had lost mine many
j >years ago). If there is anyone out there that has this information,
j >please contact me via e-mail.

Howdy John

Sorry, I've only seen S.A.M. once, many many years ago, when 8 bit computers
were the only things Atari sold.

You should check out READIT by Tom Hunt. Unfortunately it only works under
SpartaDOS, but it will read out loud every text file you want. It takes a bit
of getting used to, but it's a nice utility.

Howdy Marlin

Try contacting Erhard Puetz (aka Atreju), he knows a lot about the XEP 80
and it's abilities. Sorry, can't remember his address. Maybe you could
contact him via the German 8bit user group ABBUC (see Vendor/Developer list)
or via USF-net/IAN.

Maybe Bernard Kok is reading this and can give you Erhard's Email address.
Damn, something with @mausnet.de I guess....

C >used only half a sector. The disk speed was 25 KB per second in reading
C >and about 13 KB per second in writing.

Howdy Konrad

Wouldn't you gain lots of speed, if this stuff is done by hardware outside
the computer. This hardware could be as fast as your money will allow.

C >BTW: is there a program, which can defragmentate Sparta-disks?

FRAG by Tom Hunt shows you how fragmented you Sparta disk is. Don't really
know if he has a deFRAGger (I think he does, but I wouldn't trust my memory
:-)) I'm not that interested in Sparta. Maybe somebody could check out the
Closer To Home BBS Tom Hunt runs.

r >Subject: Re: 1.44, XF551 - Possible?
r >Date: 6 Sep 1995 21:49:04 GMT

r > Okay, Bob Puff installed a RAM, size unknown to me, to handlle
r >the 512 Byte sectors.

Where?

I've got the 3.5" dual drive conversion and it comes with a PAL or something
like it, but NO RAM. It can only READ 512 bytes sectors, no write, no format.

The FloppyBoard will do 512byte sectors though.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS the READ utility is co-written by Jeff (Mc??)Williams (sp?) and called
IBMST if I remember correctly.
The utility the BlackBox/FloppyBoard uses is called BBXFERxx.COM
xx stands for the version number. 1.7 is the latest.

STUFF DELETED

s >sir if this is a good starter system for online use i am sold
s >roy
s >rphilip@vm.temple.edu

I'm not the guy selling this stuff.

I think the price is WAY to high. If you want to go online, there are other
ways. Tell us what computer you're using and what hardware you have.
You don't need to spend THAT much money to get hardware that's even older
then the good old Atari 8 bit computers.

I suppose you have a modem? Are you using it with the 8 bit Atari?
What interface (RS232) do you have/use?

a >

Howdy Antony

a) please don't use the header to ask a question. I hate it and I guess I'm
not the only one.

b) Yes. Most come from Poland though. Try Power Per Post in Germany or
Stichtig Pokey in the Netherlands. You'll find their addresses in the
vendor/developer FAQ. ANG software used to import lots of this stuff,
but is now transfering this to Stichting Pokey because the owner of ANG
is still suffering from a whiplash he got in a accident.

St. Pokey's address is: Stichting Pokey
Postbus 425
NL-2920 AK Krimpen a.d. Ijssel
the Netherlands

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS I'm just a member of St. Pokey (Pokey foundation)

R >plan for this type of occurance.
R >Rick

Howdy Rick

I've got a Digital Multi Meter (I like toys, even though I often don't know
what to do with the results :-))

If it was the wiring, putting the plug in (at the AC socket) would cure the
problem. But then it should have happened from the beginning.

I've measure my DC voltage. It goes from 5.12 to 5.24 Volts even though
my DC power only fluctuates 1 VAC (229 to 230 Volts).

I've placed the power supply inside my minitower (cleans up the room just a
teeny bit. (apart from my 3.5" drives and the Switching PS it's empty
otherwise.) Might this cause the problem??

The 130XE is still powered by the ATARI brick BTW, the switching PS powers
my BB/FB and drives.

And I have a new problem too.

While trying to find out which pins are what on a GP1U52X (needed in the IRG
project by David Deaven), I seem to have shorted pins 7 and 8 of my joystick
port. Now my computer sometime freezes totally while it tries to access a
drive. Must have crippled something. Why didn't they put sockets in XE's???
(A yes. cheap, pre-Tramiel Atari, Tramiel Atari :-((( )

3041. Green Screen (brick gone)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-29 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <44hmn3$85a@link.xs4all.nl>
Source record: 88213

Howdy Folks

Re: my green screen

Some of you guys (why aint there no women here) mentioned that this green screen syndrom I kept having when I booted the computer and the first minutes after that (except when we had the heat stroke this summer), could come from too low Voltage.

So I grapped the MultiMeter by the probes and waited for it to happen again. It did. Measured it. Yep, 4.3 something Volts DC. When the screen "jumps" back to it's normal blue color voltage would rise to 5.1x VDC.

And not only that, but it rose via 6.xx to 7.xx VDC. And I noticed that the screen would be VERY bright and flicker from time to time. It did before, but I never toke it too serious.

So now I'm running the 130XE on the PS of the 800XE.
Man, I almost got a stroke (induced by my own body, no outside current :-)) when I thought my screen went black of a second (but I might have shorted the power with my test probes <sheaping grin>

After I unplugged the dementing brick, it tested 11 VDC. <gulp>

Maybe I'll cut the DC wire of the brick and hook it up to the Switching PS I'm using to power my BB/FB and use the brick as a paper weight.

A yes (I almost forgot) THANKS DUDES you saved me and my beloved 130XE (the only computer with a US+ OS and Gumby Stereo).

>spending money on one of their other overpriced games.

Right. It's pure marketing these days. This sort of thing started
in earnest in 1983 or so, if I remember correctly. That is, publishers
began to realize that the programming didn't matter as much as the
marketing. This is the same type of reasoning that gives us the bulk of
our consumer products (shirts with an allegator on them, 179 dollar shoes,
etc.): Produce a standard or sub-standard product,then market it as
something really "cool," and you'll make millions.
If you're a teenage videogamer, you /must/ have Mortal Kombat,
because if you don't you're not cool. All cool people play Mortal Kombat -
that's what the ads tell us,and that is what has become the accepted
perception among gamers in the target audience.
It's sad, really, that humans are sheep. The marketroids play
us like a fiddle, and we obviously love them for it.

>They are trying to confuse you. "Hey, we have a zillion levels in there. It's
>a great game. Lot's of new stuff each level." If they had less levels, etc.
>you might get smart and realise that you get less then what you paid for.

Hehehehe. Wouldn't want the sheep to realize they're being fleeced,
now would we? ;)

Thanks. :) It's nice not to be counted among the sheep anymore,
isn't it? :) Not to mention how cool it is to amaze your friends and
co-workers with the fact that such a computer-oriented and knowledgeable
person would use an "ancient, outdated" computer not just as a toy, but
in every way a home computer can be used. ;)

Only two of us? Really? That's too bad. :(

I think there were articles in BYTE (circa 1982?) and in Compute! that
may explain this business as well.

So what is it you really wish to accomplish with all this, if I may
be so bold...?

Dunno. Although my recently deceased BBS offered QWK support, I
never was much for it. I like the interactivity of being online when
replying - you can go back 50 messages in the thread in order to remind
yourself what started it, if necessary, for instance.
And, I don't think Delphi offers QWK support. the BBS's I call
do, though.

But, if I ever need an offline reader, I'll definitely choose
PabQWK (or CTH-QWK, if that's the current product at that time).

There IS a very simple public domain version of this available for IBMs called Biomorph. I think there may have been a type-in program similar to it published in one of the Atari magazines years ago, but I'm not sure. I would doubt there is an exact port of the C-128 program you are talking about. Take a look at the original Dawkins article, if you are into programming at all it would be an easy project to whip up a rough version of it yourself.

Found it! Byte, February 1982. I had forgotten how great Byte used
to be. A footnote says the article appeared "in slightly different
form" in De Re Atari, but I don't have that.

I found Inside Atari Basic, then I remembered what I once knew: that
has to be one of the worst possible titles for that book. It doesn't
get into the innards of Basic at all -- it just teaches novices the
basics of programming Atari Basic.

3048. Microvision/Arcadia2001/SMS/Atari 26/52/400 Auction

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-30 00:00:00 UTC
From: jap5r@virginia.edu
Message-ID: <DFq54v.LFy@murdoch.acc.Virginia.EDU>
Source record: 88220
Cross-posted to: comp.sys.atari.8bit,rec.games.video.sega,misc.forsale.computers.other.systems

This is the first of a series of auctions which I will hold to start
selling the remaining parts of my collection. Rules are at the end.
Systems represented here are, Atari 2600/5200/400, Arcadia 2001, SMS,
and Microvision.

Arcadia 2001 Cartridges all with boxes (I=docs, #=overlays)
Several of these have catalogs with them.
#14 American Football I $3 Min
#5 Space Raiders I2 $3 Min
#10 Missile War I1 $3 Min
#15 Baseball 2 $3 Min
#20 Tanks A Lot I2 $3 Min
#2 Space Attack I(torn) $3 Min
#1 Cat Trax I2 $3 Min
#17 Breakaway I1 $3 Min
#3 Escape I2 $3 Min
1 Jungler overlay

Sega Master System*
Sega Master System, original console with Hang-on/Safari Hunt loose
cartridge. $5 Min
Possibly flaky automatic RF cable $2 Min
Sega Master Power supply $2 Min
Sega Master control pad $2 Min
Sega Master control pad $2 Min
Master System Light Gun $5 Min
The following cartridges all with boxes
Hang-On Safari Hunt $2 Min
Great Football $2 Min
Black Belt $2 Min
Gangster Town (instructions) $2 Min

Microvision
Two battery model Microvision in original box with original packing
and the Block Buster game $50 Min

Cartridges in their original boxes with original packing and manuals.
Connect Four $10 Min
Sea Duel $10 Min
Baseball $10 Min
Pinball $10 Min
Star Trek Phaser Strike $10 Min

Atari 2600
Boxed and sealed (some from FBE)

Battlezone $2 Min
Space Invaders $.50 Min
Realsports Baseball $1 Min
Galaxian $2 Min
Kangaroo $2 Min
Ms. Pac-Man $1 Min
Solaris $1 Min
Realsports Football $1 Min
Pole Position $1 Min
Phoenix $2 Min

Atari 5200 All with boxes (boxes a little beat up)
Space Invaders, Instructions and 1 overlay $1 Min
Realsports Football, Instructions, playbooks and 2 overlays $2 Min
Super Breakout, Instructions $1 Min

Atari 400 (All loose)
Space Invaders $2 Min
Music Composer $2 Min
Asteroids $2 Min
Pac-Man $2 Min
Centipede $2 Min
Football $2 Min
Qix $2 Min
Super Breakout $2 Min
Dig Dug $2 Min
Donkey Kong $2 Min
Atari 400 console with powersupply, Basic cart, attached video cable(
not all the keys tested, used mainly for games) $5 Min

Rules: (still under construction)

1. Minimum bids are posted, minimum increments are $.50 when the price
is <$5 and $1 when the price is >$5 and $2 when the price is >$50.
2. Shipping will be added to all orders, minimum charges are $2 for
the first cart and $.50 for each additional, valid only for CONUS,
system shipping charges will vary.
3. Please no bid with drawl, I will be having more auctions/sales in
the future so keep that in mind.
4. I reserve the right to change these rules and pull any items from
the auction for an immediate sale and am not responsible for any errors
in this post.
5. For the SMS, Atari 400, Microvision, I may not sell the
carts/accessories unless I also get someone to buy the system.
6. The only trade items I will consider are a TV tuner for a GG,
possibly the older model GG for the TV tuner and 72 Pin SIMMs.
7. The auction will end on the weekend of October 14, I may choose to
change the auction to a new/once/twice/sold system before or at the end
depending on bidding.
8. Payment is expected in advance of shipping by a money order, or a
personal check if I have personally dealt with you before.

9. Updates will be when I can get the chance, I may set up an automated system, where an e-mail update would occur everymorning, I will try to limt updates to the newsgroups.

3050. Re: Anyone got the Umich FTP address?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-30 00:00:00 UTC
From: mmercado@valdivia.uca.uach.cl
Message-ID: <1995Sep30.083526.21435@halcon.dpi.udec.cl>
Source record: 88222

Hi Cliff:

- Here is the Umich atari archive:
ftp://wuarchive.wustl.edu

- this site is hard to reach. I found a mirror at:
ftp://ftp.toad.net/pub/umich

- You can download Xformer v.2.52 from:
http://www.halcyon.com/brasoft/xf252/xf252.zip

- Also you can find tons of interesting things and programs for atari 8bit at:
ftp://ftp.clark.net/pub/atari/mag/antic
ftp://ftp.clark.net/pub/atari/mag/analog

Finally by using search tools you can look for anything you want:

Use Yahoo: http://www.yahoo.com
or Lycos: http://www.lycos.com
If you prefer a comprehensive set of www search tools point your web browser
to: http://cuiwww.unige.ch/meta-index.html

If you use this tools, you will never need ask anybody for a program or a
piece of information on the internet.

Hope this helps you ... MMO ;)

The BASIC TOKEN list in "DE RE ATARI" is a lot clearer, but the explanations in "THE BASIC SOURCE BOOK" are a must. I tried detokenizing a BASIC program that had been clobbered by doing it by hand from a hex dump, but I made too many transcription errors. There is a nice detokenizer program written for the MAC65. I've never seen a BASIC detokenizer. I've often wondered if maybe the reason I haven't seen one was because there was a shortcut, such as copying source bytes to a buffer and then just calling the BASIC "LIST" kernel subroutine for translation. I'd still like to recover that trashed BASIC disk. I munged it with the BASIC program "Disk Doctor" when I had no idea what a Disk Doctor was or how one should be used. Now I always make a working copy before I mess with anything. (I never got around to finishing with the BASIC disk as I lost interest in it.)

Much to my sorrow, consternation, aggravation and
embarrasment, I must report a MAJOR problem with SIOP2.COM,
as found in my recently released 'PCUTIL.ARC'. I've found
that following my doc's directions (format the data disk
using the pc), SIOP2 will not write sectors to write a file
to a PCUTIL disk. I apologize for this, as anyone trying
'SIOP2', as I did tonite, will get nothing but error 138 or
144 when trying to write the Atari file to the PCUTIL disk.
Until I work this out, which may be a while, you GOTTA
format the PCUTIL disk using your Atari drive, when writing
files on the A8 to a pcutil disk. Further, you must use
SpartDOS to do the formatting. This is a problem in the
program where it tries to determine the type of disk in the
drive.
For writing a file located on the pc to a disk, the format
using the pc still holds.
'Curses'.

I'm asking anyone who has it up, ftp or bbs, to pull it for now.

I am proud to announce the establishment of the Video Game Advantage WWW site. VGA buys/sells/trades used videogame and cartridge based computer systems and games. VGA carries over 45 different systems.

In addition to FS/T and want lists, you can find videogame & computer system FAQs, game screen shots, videogame related WWW links, and game ratings/reviews.

I hope that if you have WWW access, you will visit us soon and see what VGA has to offer.

You can find VGA at: http://www.io.com/~vga2000/

3063. Help: How can I run gdos in ms-dos?

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-01 00:00:00 UTC
From: sang@www.sang.com
Message-ID: <44lv3a$iqf@solaris.cc.vt.edu>
Source record: 88235

Is it possible to run gdos or gemdos in a ms-dos platform?
It seemed to me there should be some emulators.
Also where would I find the files in the net and what's it called?
I'm a newbie so, appreciate it if someone can help.

Thanks.
sang.

Thankyou for you response to my original post.

I have missed my Atari 800 so much since i sold it three years ago and was so glad when i came accross a P.C. emulator. Can someone please post such classsics as Drol, Archon, Air Support, Spelunker and any other classic games with good play-a-bility so that i can relive the good old days of the Atari 800

Yours Hopefully

Kevin

Welcome to:

THE UNOFFICIAL ATARI 8-BIT NEW USER, EMULATOR HELP FAQ

Revision 0.95, August 29, 1995

By Bill Kendrick

------------------------------------------------------------------

[ Differences from Rev.0.9: Fixed newdex-friendliness; had to do with
less-than and greater-than character hanging around loose! ]
[ Differences from Rev.0.8: Added the missing list ending tags and
some active links (still trying to make it newdex-friendly! [frown!] ]
[ Differences from Rev.0.7: (Weakly) Converted to HTML! ]

------------------------------------------------------------------

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
[ not done ]
Finally, you can always ask Michael for a copy at
mcurrent@carleton.edu
------------------------------------------------------------------

Summary of Atari 8-bit's and emulated 8-bit Atari's:

* Real Ataris: Atari 8-bit computers were produced between 1979 and
1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when
made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends
when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile
Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC
can be purchased on cartridge for the 400/800/1200XL's.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.0 and 2.5x. 2.0 is limited and supports
only 800 OS. Both public domain (were always PD).
```

o PC Xformer 3.0x. Supports all OSes, 320K RAM,
player/missile collision detection (which MANY games
use!)
+ On Apple Macintoshes:
o Rainbow
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit
machines. Very limited. Now public domain (used to be
commercial).

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard,
non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2,
160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4
graphics are also supported. 40 x 24 x 256-character (128 normal,
128 inverse, character set indirection available) text mode is
standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character
allowed, the other 128 characters have 4th changed into a color 5)
and 40 x 12 x 128-multi-colored-character screen modes are
available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16
hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned)
screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the
Display List (a program which is executed by the ANTIC graphics
chip every screen refresh (60 times per second on real NTSC
Ataris).
* Fine scrolling (both vertical and horizontal) can be enabled on
any line on the screen.
* All other screen attributes (color, player/missile horizontal
position, screen width, player/missile/playfield priority, etc.)
can be ajusted at any point down the screen via a "Display List
Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and
four 2-bit wide, 128 or 256 byte high single color missiles are
available. A mode to combine the 4 missiles into a 5th 8-bit wide
player is also available, as is a mode to XOR colors or blacken
out colors when players overlap (good for making three colors out
of two players!) Players and missiles have adjustable priority and
collision detection (which is not supported by the PC Xformer 2.0
and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3

and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
* A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten, well, fed up with the XF2-based questions which did not pertain to them, or to the really dumb questions which were in fact understandable to new or rusty Atari 8-bit users, but had just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits [grin]).

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

Since revision 0.7 of this file, Rainbow, an Atari 8-bit emulator for Macintoshes, and "6502", an Atari 8-bit emulator for Unix, have been released, and a 4.0 version of PC Xformer has been announced (and will require Windows 95).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.
2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.
3. How do I turn off BASIC?

To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).
4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!

See "Why doesn't this program load?", above.
5. How do I exit XF and return to DOS?

Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).
7. How do I use MSDOS files with XFormer?

Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image). Example: XFORMER MYDOS45.ATR filename.ext

When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.

Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).
9. What's SIO2PC?

Refer to the XFormer and SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced Atari 8-bit users).
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to "dir i:*.*")
+ [A] Disk directory (like "dir " and optional output destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one place or disk to another, just "[source]" copies from one place on one disk in a drive to the same place on another disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted first) (add ">*.*" or ":*.*" after a subdirectory name to delete the files within it. A subdirectory name alone will delete the subdirectory (if it is empty and unlocked)). (Acts like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but be careful). (like "ren [old] [new]" in MSDOS - with MyDOS, use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending (like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which boots with the current version of MyDOS you are using and also has the menu file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a quick-format of an already-formatted disk (ie, just a very fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot sector, when using XFormer, it's much quicker to just copy one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like "[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is "E477", reset is "E474" (these are the hex values of the addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC, for example) it will write what is in memory to a file "MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost forever. When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV is reloaded and the environment should be as it was when you left. It's probably quicker to simply "SAVE"

your programs (if in a language) which aren't nearly as big as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly for advanced users or special setups. See the MyDOS docs for details.
+ [P] Set density. Forces a drive to be recognized at a certain density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS) This makes "D:" now the same as a subdirectory or other drive. ie, "D2:" will make all calls to "D:" act as though they are to "D2:" instead. Some programs when prompting for filenames do not add "D:" to the beginning if one is not present, they add "D1:". If you don't trust a program to look to "D:" instead of "D1:" and you want it to look to some place OTHER than "D1:" (ie, where "D:" is pointing which could be a VERY long path list), just add "D:" to the beginning. ALSO, some programs don't even ADD "D:"'s if they aren't in the filenames you give and may give errors (138, for example: device not present, ie, if you said "TESTFILE.DAT" it may think you want "T:" instead of "D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify is on, writes will be slower but 100% reliable. With it off, writes will be much faster but possibly not as reliable (on bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk,

you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the

"root", and all of the "Folders" within it have more windows
in them which also have file and folder icons.

Here's a comparison to using subdirectories on different
DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other
DOSes are not necessarily using drive 1, and MyDOS and
SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the
'current' or 'default' directory to a different place (a
different drive or a subdirectory). "D:" can stand for "D1:"
(like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ
THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files,
multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard
and output to the screen is normally handled. If you
wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using

"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line
into the current program.
* Entering a line number alone will remove that line from the
current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command
followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional

destination device ("D:file.lst", "P:"rinter) and an option start and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
* For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing when it appears. One problem, however, all screens overlay each other so unless you only use certain modes at certain times, parts of some screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text

* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)
* DRAWTO x,y - draw a line from cursor location (set with "POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command colors:
* COLOR 0 will draw using the background color, set with SETCOLOR 4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd into memory locations 704, 705, 706 and 707 (the player/missle graphics color locations). Examples of this will be presented in the BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)
* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor") allows the following characters for editing:

Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)

Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)

Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! [grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.
* When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where

the blank space was. When you are finished doing that for each
line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to
turn on the no-edit mode (ALL characters except End Of Lines will
appear, even ClearScreens!) When you want to go back into normal mode,
set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model,
etc) minutes, the screen colors begin changing, thus protecting your
TV or monitor from having a static image burned on it.
* To turn this mode off, press a key, or, if within a program, use
the command "POKE 77,0" at least once every few minutes (IF the
screen is active, otherwise turning it off would be kinda
useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or
having location "77" set to "0", or set location "77" to "128"
with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary
mode 'c'. Channel 'a' must be free or else a 'Channel already
open' (129) error will occur. To explain the different "modes",
here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"
Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'

* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores the numeric value of
it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed types are
of course allowed).
* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program "Util" on the IBM which can read double-density Atari disks. Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive!

[cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time
anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and
not "ATR"? To keep people from getting confused with the
ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR"
which works on PC's (a PC executable version comes in the archive)
and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

+ PC Xformer 2.0 and 2.5 can be downloaded via FTP from:

In article <44jm8g$bvo_001@brat.interlog.com>,
Bernie Rataj <brat@interlog.com> wrote:
>Of course, you'll have to implement a CIO for the target machine as
>well...

Yep, I thought of that.

D1:,D: -> current directory of system
P: -> system printer (i.e. lp or lpr program in Unix, PRN device
in DOS)
R: -> system modem

E: -> user terminal

K: -> cbreak mode of terminal (use curses?)
S: -> use curses?

Others would respond as if the device is not connected, although it
might be nice to be able to specify directories to use for other disk
drives. Maybe allow using ATR/XFD disk images, but that's getting
into emulator territory.

I'd start with E:, and do the rest after that version worked fine.

But all this is far in the future; right now I'm just trying to get my
lister working. (Right now it works fine until it gets to a number,
variable, or quoted string. Which means it lists a program of REMs
just fine. :-)
Which reminds me: Can somebody briefly describe the 6-byte floating
point format? None of my references describe it.

3068. Trouble with Portal to umich

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-01 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <146239@cup.portal.com>
Source record: 88240

Just a word of warning; tried getting a good copy of my IBM<=>stock 1050
program to umich w/o success. Transferred it twice & made sure the
binary mode was set <at least for my 2nd try>. I immediately downloaded
both files & while they both ahd the same length, they were corrupt.
So, the one there in Diskutils has the MS DOS .EXE busted, the .C
source code in ATASCII with the line length truncated to 80 columns &
in the New area there are two files, MSMULE.ARC & IBMMULE.ARC, that
are broke. There's a good copy of the file on Portal in the 8bit
sig, but for some reason I can't get it to forward properly. I *NEVER*
have these problems with oak.oakland.edu so I'll make a effort to see
if they'll let me upload it there.
Rick

Hi, atarians.

I'm now using 130xe and sio2pc, and I learned some 6502 code on it.
And, I have some questions.

1. I want to use graphics on it, please let me know.

2. When I make some graphics craractor, what should I use? On the
other hand, should I use some gfx editor or other tools?

I think ONE simple assembler source solves "1." probrem. Can
someone send me a source which do ONE charactor moving in a screen?
And if it uses display list, I think it's more cool.

Can someone help me?

WARRING: I can't read c.s.a.8 so well(I'm reading news via E-mail,
and it's slow), so please send me E-MAIL *too*.

-Texas Instruments Speech Synthesizer $8.00 min

-TurboGrafx 16 Multicontroller adapter $5.00 min

-Wico Command Control Joystick $3.00 min

TRADES:

I am looking for R/ER/UR carts and a few UUs for
the Atari 2600 and Colecovision only!

HERE ARE THE RULES:

1. This auction will end on Sunday, October 14, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject should be SWAPMEET BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.50 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $8.00 and $15.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee, no warranty and no refunds
on anything purchased from this auction. Most of the
cartridges have been tested and do work the same goes
for many of the systems. However, cartridges for systems
which I do not own cannot be tested and neither can
systems which have no cables.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: jrm8248@u.cc.utah.edu

3071. What should I download?

Newsgroup: comp.sys.atari.8bit

From: ziggy29@rahul.net
Message-ID: <44ngc0$bdj@bug.rahul.net>
Source record: 88243

So many files, so little time! I've seen the index of stuff which
can be found at UMich and its mirrors. The problem is that I have *no
clue* where to begin. What is the really good stuff there? Does
anyone have recommendations?

I'm an avid gamer of most types, primarily action/arcade and
fantasy/RPG stuff. I also looked at some productivity tools, general
system utilities and languages/development tools.

So what say all ye?

The Atari 8-Bit Computers Frequently Asked Questions List was created to
provide answers to many commonly asked questions found in the Internet's
comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group. It is in
a constant state of development, and comes with no guarantees. If you
see any problems, I need to hear from you!

12.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the power-supply requirements for my Atari components?
13.4) What are the pinouts for the...?
13.5) What BBS software can be used on the Atari?
13.6) What version of Atari BASIC do I have?
13.7) What are the Standards for Used 8-Bit Stuff?

Other Documents of Interest
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

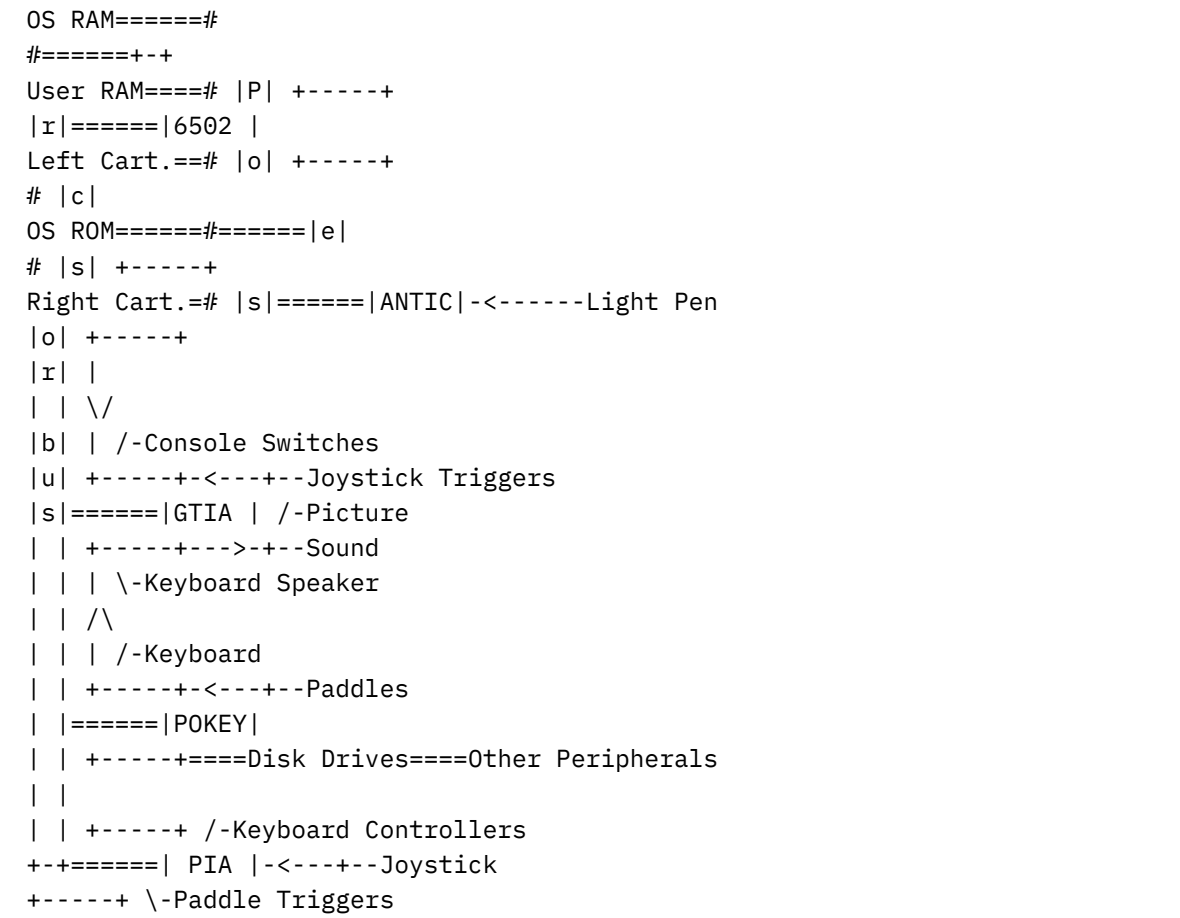
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexor. According to URL:mailto:masstorage@closer2.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank

of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill Kendrick, URL:mailto:kendrick@sonoma.edu , for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,

and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through URL:news:comp.sys.atari.8bit . This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

comp.sys.atari.8bit is archived by the INFO-A8 list server.

Subject: 2.2) What is comp.sys.atari.announce?

URL:news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from URL:mailto:lexicor@world.std.com .

Subject: 2.3) What is comp.sys.atari.advocacy?

URL:news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

URL:news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

URL:news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

URL:news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest

possible audience when making 8-bit Atari emulator announcements.
The moderator may be contacted at URL:mailto:emulators-request@qualcomm.com .

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

URL:mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, or to start a new thread, send your posting either to URL:mailto:comp-sys-atari-8bit@cs.utexas.edu or to one of the other mail-to-news gateways mentioned elsewhere in this FAQ list. Postings sent in this way automatically appear on comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to atari8@netcom.com will NOT be cross-posted to comp.sys.atari.8bit, so don't send your posting there. The Moderator hopes to correct this in the future.

The Info-Atari8 Digest is archived by the INFO-A8 listserver.

Recent copies are also kept at URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, URL:mailto:snyder10@convex1.TCS.Tulane.EDU .

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
URL:mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to URL:mailto:comp-sys-atari-8bit@cs.utexas.edu or to one of the other mail-to-news gateways mentioned in this FAQ list. Postings sent in this way automatically appear on comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to URL:mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST or to info-a8@vm.marist.edu.

---The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8---

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to <URL:mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
URL:mailto:ravi@mcnc.org (Ravi Subrahmanyan)
URL:mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu . The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn). Please name the parts in the subject line. This is really helpful as the parts usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you get started using it, try this example of retrieving files from the Merit/Umich Software Archives (through the barnone.citi.umich.edu mirror site). Send a message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu ; the Atari Archive as a whole is
maintained by mailto:boydm@atari.archive.umich.edu (Mickey Boyd).

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
----
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by
mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos,
SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari

Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu .

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser

in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Gopher to

gopher://gopher.archive.umich.edu

and choose Merit Software Archives, or Gopher directly to

gopher://gopher.archive.umich.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

8-bit Vendor/Developer home pages are listed in the Vendor/Developer list, not
here.

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.smartpages.com/bngfaqs/comp/sys/atari/8bit/top.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

If your local system supports AFS, this method of accessing the Merit/UMich
Archive is a breeze.

Downloading

Just copy files from file:///afs/umich.edu/group/itd/archive/atari/8bit/

Uploading

Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

Subject: 7.9) What IRC channels discuss the 8-bit Atari?

#Atari8 - Just for 8-bit Atari users!

#classic - Classic Games and Systems Collectors.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online
magazine of the Cleveland Free-Net Atari SIG. The editor is Mark
Leair of the Atari SIG. 8-bit computers support is provided by Michael
Current and Craig Lisowski. For information, write to the Atari SIG at
mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc

Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the three emulators that are usable.

1) ST Xformer 3.0, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.
Net location?

2) PC Xformer 3.2, from Branch Always (see companion Vendor/Developer List for complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 was the first commercial version; 3.2 is the latest commercial version; 4.0 is scheduled to be released in October '95.

The following further info on PC Xformer provided by Bill Kendrick, mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU. It does not support ROM files, disk image swapping within the program, player/missile graphics collision detection, sound, PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800 or an Atari 800XL. It requires about the same as 2.0. It does support ROM files and the PC speaker is used to emulate the old Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

3) Rainbow, by Chris Liam, for the Apple Macintosh
URL:mailto:lamcw@aston.ac.uk
URL:http://www.aston.ac.uk/~lamcw/emulators.html

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)

File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

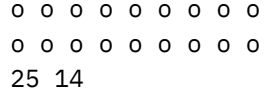
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track
buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) unknown DOS restrictions

==> Supermax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)
by Super products. Compatiable with superdos and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only

thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into

SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions

1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area. I'm not sure whether his BBS for the Atari 8-bit has been placed into the public domain or not. This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 13.6) What version of Atari BASIC do I have?

Subject: 13.7) What are the Standards for Used 8-Bit Stuff?

Developed by mailto:b.poehland@genie.geis.com (Ben Poehland)

When selling used 8-bit Atari equipment in the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group, please consider describing the condition of the materials you are selling using these standards. This will go a long way toward preventing potentially highly-contentious misunderstandings. Usage is voluntary, but recommended.

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging materials.
EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories;

heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

```
;speaking of Rainbow, I can't get the damn thing to run. I was wondering
;if someone could tell me what I am doing wrong. I've got the os in the
;rainbow folder as per the instr. Each time I try to run rainbow 680x0
;I get an "out of mem." error. I'm trying to run it on a 68030 centris
;with system 7 and 8 megs memory. Thanks in advance.

I responded to this problem in an earlier post. On some machines, the
allocation of more than 4 sound channels is a no-no, hence the
error. The solution... I'm not sure since I've only seen it fail
on one machine.

If you do see this bug please email me with details i.e. your machine,
system version, extensions etc.

Regards,

Chris Lam.

3077. For sale or trade -- CSS MUX, 256k MIO, MFM hard drives, Adaptec controllers, etc..

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-02 00:00:00 UTC
From: jeking@xmission.com
Message-ID: <44pfub$b1c@news.xmission.com>
Source record: 88249

I have the following hardware for sale or trade:

(1) CSS Multiplexor w/3 slave carts, 60foot of ribbon cable, roms, manuals, software, etc..

- The MUX allows you to share peripheral devices (hard disk(s), printers, floppy drives, etc..) using a master (file server) computer and up to 8 slave (workstation) computers. Works on 65xe, 800xl, 130xe and XEGS

(2) 256k MIO w/printer, modem and 50pin SCSI cable(s)

- The MIO allows you to run virtually ANY MFM, RLL or SCSI (old style) hard drive, use a 19.2k+ modem and control your printer(s) via a print buffer - which can also be used as a 256k virtual ramdisk

(3) Ton of 20-40meg MFM hard drives (mainly 20meggers)

(4) 4 x Adaptec 4000a MFM to SCSI controller cards.

- These cards are required to use any MFM drive on your MIO

(5) 540 and 1.2GIG IDE (Western Digital) hard drives

>the computer. This hardware could be as fast as your money will allow.

Perhaps, but I cannot build anything - I am programmer only. My friend has
built the interface and I have written some software for it, as speedy as
I can (36K reading, 7k writing actually).

My friend said, that the speed can be improved by building the DMA-circuit
for the disk. Each clock-cycle could store a byte in memory then, so
the speed could reach up to 1770 kilobytes per second (channel rate, of
course). But there must be a DOS, which can manage files on a 512-bpsector
disk, because hardware-emulated 256-bpsect. disk would make the interface
too complicated.

CM> Please...
CM> Tell me how can I pass from a diskette to a tape, programs from
CM> [an] atari 130XE?

There are two programs, part of a set of BASIC programs that allowed
you to do things like perform a HEX dump of memory (I remember this because
I used the program to look at the ATARI character table in ROM), which do
this type of transcription. One is called, "TAPE2DISK". The other is
called "DISK2TAPE". These programs shuttle disk sectors back and forth.
(I can't remember if they also correctly handle the tape header for you, or
if you manually have to add the binary tape leader yourself.) If you just
wish to move programs back and forth, you can copy directly to the "C:"
cassette device. The cassette is a serial device just like the printer. No
name is given, e.g. "COPY D1:FILE.BAS C:" ("COPY D1:FILE.BAS,C:" ?)
Use MyDOS for this copying, if possible. MyDOS handles the "C:" device
expertly. I was amazed that I could freely use the "C:" device anywhere in
a DOS command. If you don't have MyDOS, you can LOAD a BASIC program from
disk into RAM and then SAVE it to cassette, e.g. "SAVE C:".

CM> How can I make a menu in a diskette of ATARI [programs]?
CM> Thank You

You need a "boot loader" menu that handles binary files. There was an
excellent one from BEWESOFT (I think ?) that can handle up to a thousand
entries, scrolls the directory up and down, and loads files in the blink of
an eye! It just came out, reaching the United States some time in 1993, I
think. It is a really professional piece of software coding, really very
slick. It is the best "menu loader" type program that I have used aside
from DOS, itself ! I wish that I could remember the name of it. I think
that it was at UMICH in the same software directory that had the "DIR-T"
(or was it "DIRT") extended SPARTA-DOS directory program (the program that
shows the "archive" bits in the SPARTA diskmap...). You then copy the boot
loader onto a blank disk and rename the file "AUTORUN.SYS". Good Luck!

You can't "uncompile" back into a high level language. About the best
that you can do is "disassemble" the machine language back into assembly
language (assuming that the E-Prom code is native 6502 code). Any "sector
editor" program should come with a "disassembly" option. Output from a
disassembler is a "best guess". You still have to know the details of the
machine's internal hardware so that you can start and stop the disassembly
at many points. The disassembler can not tell the difference between data
segments and program segments. For example, if you start disassembling the
ATARI's character shape table, the disassembler attempts to interpret the
data shapes as if they were an assembly language program and gets all
confused. Without detailed knowledge of the hardware layout of the machine
that the program runs on, you could have problems interpreting the machine
code. If all that you are interested in is the decision making "artificial
intelligence" of the "game decision tree" and how to write your own poker
playing games, may I suggest any book written by David Levy, author of the
chess playing program "SARGON". He wrote many articles in the magazine
"CREATIVE COMPUTING" on how to program "games that think".

There is a problem with YMODEM batch. I am told that it is because
BOBTERM is using an XMODEM padding style and that it --SHOULD-- be called
"XMODEM 1K BATCH"

MN> PS. Don't Unix's use inverse lowercase C's to end a line???
MN> * PabQwk 2.0 *

No. I believe that UNIX uses LINEFEED as a record terminator, in the
exact same manner that the Commodore AMIGA does. The inverse lowercase 'c'
is the record line terminator that is used in a QWK-MAIL data packet.
(NOTE: See the documentation of the ATARI TurboBASIC program QWK-Silver.)
An IBM QWK-MAIL offline mailer would convert a Ctrl-M, Ctrl-J pair into an
inverse, lowercase 'c', which I --THINK-- is an IBM cent sign graphic ? A
Unix QWK-MAIL offline mailer such as U-QWK, SOUP, or YARN, would convert
LINEFEED into an inverse lowercase 'c'. PABQWK, of course, would convert
an inverse <ESCAPE> into an inverse lowercase 'c'.

(NOTE: Just for fun once, I went into TEXTPRO and created 128 byte
records that conformed to the QWK header standard. I then converted every
end-of-line into an inverse 'c' and attempted to upload it. After ARC-ing,
the message data packet was accepted, no problem!)

> In programming Critters, I've gotten more and more tired of
>switching to Atari DOS in order to save the CRITTERS.OBJ file with a
>start address as CRITTERS.COM. Isn't there any way to do this from
>SDX?

No. The only (simple) way I know, goes as following:

1) run the Turbo BASIC (XL or not)
2) type in the following program:

```
10 OPEN #%1,9,%0,"D:CRITTERS.OBJ"
20 PUT #%1,$E0,$02,$E1,$02,$ll,$hh
30 CLOSE
```

Where $ll is low, and $hh is high byte of your start address. If your program starts from, for example, $2695, line 20 should be:

```
20 PUT #%1,$E0,$02,$E1,$02,$95,$26
```

3) run it.

Another good idea is to write an utility to link programs with their start addresses.

>+-----------------------------------`----------+

On the PC, a fixed clock frequency is passed into the timer chip that does
a frequency divide and then passes that signal on to one of the DMA
channels that performs refresh.

Do you suppose this is what you needed?

>>30 CLOSE

>Whoa - please explain this syntax. I didn't know TBXL could do that! :)
>-bill!

Here you are :)

1) integer numbers from -3 to 3 have been defined by F.Ostrowski as
constants: -%3, -%2, -%1, %0, %1, %2, %3 (why seven numbers only? very
strange I think). They take only 1 byte each, instead of 6 bytes.
So if you write PRINT FRE(0), you will see 34021, but PRINT FRE(%0)
will display 34027 (TB XL 1.5)

2) GET/PUT commands can have multiple arguments (but I don't know, how much;
probably not more, than 256): GET #%1,A,B,C will get three bytes from
stream #1, PUT #%1,A,B,C will send three bytes to stream #1 and so on.

3) CLOSE (without arguments) closes all streams (except #0)

B. :)

In article 145906@cup.portal.com, jharris@cup.portal.com (John D Harris) writes:
>What do you mean here? I use DLIs on LMS lines all the time.

I was under the impression that a display list instruction an LMS bit set
makes ANTIC ignore the DLI bit. I'll have to check my Hardware Manual.
I'll get back to you on this.

>I also second the suggestion made by someone else to use redefined
>characters as well. You could create some fairly simple objects like
>rocks or tree trunks and shift them through the playfield characters
>at a rate faster than the playfield is scrolling.

I mentioned in an earlier post that I was still unsure whether
this would be faster than hardware scrolling. I want 8 scrolling
ANTIC mode 4 lines with data that doesn't appear repetetive (i.e.
it will repeat, but only after a while). I won't be mixing in
any other backgrounds into this as PMs will be the basis of action
across the scrolling zones. Hardware scrolling will require some VBI
and DLI manipulation while the "character scrolling" will
require something like 46x8x8 bytes to be manipulated (in my situation).
I'm unconvinced it will be to my advantage in what I want to create.

3107. DCM2ATR 1.4 is available

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-04 00:00:00 UTC
From: cmwagner@gate.net
Message-ID: <44tf2f$1pd4@news.gate.net>
Source record: 88129

DCM2ATR is now available via ftp from
ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr14.zip for DOS users or
ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr14.tar.gz for UNIX users.

A important bug was fixed that is likely causing corrupted images, it is important that you grab this and update your version. The bug will not damage your disk, or the original files, but it will create worthless disk images, and I hate to think that someone is out there getting pissed off because none of these archives work.

So please grab the latest version, I am not sure if this has been an inherent bug in the program and has just been discovered or if it was created with 1.3, but this is the first I have heard of it, and thanks to Mike White (lovegrov@student.umass.edu) it was fixed, and he also provided the new routine to fix the problem, which I have no idea why I didn't approach it the way he did. That is one of the reasons I like to make source code available to the public, they can see things that I may not.

Grab the latest version, 1.4, and Mike has also said that he will be providing an Macintosh version, so if your interested in a Macintosh version then follow-up to this thread and he will probably get involved. His version is based on 1.3 with his bug fix so it is essentially version 1.4 but is a Mac version, I am going to provide the program also at the same ftp site, probably as:

ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr13.sit.hqx for Macintosh users. Please get ahold of it and you may send me reports of bugs, and I will probably forward them to him, if they relate to the Macintosh, but with version 1.5, hopefully, I will have a version that will compile under Macintosh based on code written by Mike, but this bug was so important that I could wait to incorporate it and join the two as version 1.4.

(that archive may not be available, for Mac, right away, so if you can't find it, check back in a day or so, I will probably have it on after an hour or so of the time stamp on this message)

3108. Critters Update (10/4/95)

Newsgroup: comp.sys.atari.8bit

From: Joe Walsh <ransom22@delphi.com>
Message-ID: <hBLAPoR.ransom22@delphi.com>
Source record: 88130

Howdy,

I just performed a new "first" for me in ASM: I got a Player onto
the screen! I know, big deal, right? But, although I have done it many
times before in BASIC, doing it in ASM feels good. Every time I do one
of these "firsts for ASM," I feel really good. Accomplishing new things
is great. :)

Tomorrow, if I have the time, I plan on getting it to move around
in response to the joystick. From there, I will set up the routines to
allow the user to: place wall sections, pick up and drop critters and
plants, place new critters and plants, and destroy an any object (be it
a wall, a critter, or a plant). This will make the program far more
interactive, and will also allow the user to set up many situations to
explore with A-Life.

Once I have all that done, I'll uuencode it and put it here for
those who are interested in exploring A-Life on an Atari8.

Believe it or don't...but Newsweek is bigtime into the Web and covering
the "Information Superhighway". They have a weekly page covering hot
topics and publish their reporters' email addresses as part of the byline on
many articles.
The weekly (hardcopy) page is "Cyberscope".
The magazine letters column email address is "letters@newsweek.com",
or "newi50a@prodigy.com".
Do a Yahoo on "newsweek" and you'll find the Webpage.

3112. SAMS Schematics for the 8-bit 800xl

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-05 00:00:00 UTC
From: saw151@psu.edu
Message-ID: <saw151.1.3073469B@psu.edu>
Source record: 88134

Hi, I was curious if anyone out there had the Sams schmatics for the atari 800xl, I am working on a project to connect outside devices for the 8-bit to control. Any help is greatly appreciated :) If anyone knows of an indepth book that explains the interworkings of the Databus and Memory access, that would be very helpful too:) Thanks,

ps. This is for an independent study for college.

>exactly this.
>It is of course not very efficient to have a complete background scrolled by
>redefining chars.
>BUT. If your background is just a repetitive pattern, it gets very effective.

Yes, thanks, I did understand that it would be very efficient with a
repetetive pattern but my original intention was to get away from the
backgrounds which look repetetive. Repetetive backgrounds started to
get to me after a while and so I wanted to have a bit more variety
which means I cannot use the "character scroll" method.
But this discussion has raised many interesting points and I'm glad
there are a lot of experienced programmers still "out there" who can
respond to questions on topics like parallax scrolling. I'm not
going to be ignoring everything I've heard here, that's for sure.

Thanks, Jg.

I don't suppose anybody at Newsweak<sic> watches tv? Atari is still
advertizing on a regular basis.
I just heard the rumor, from probably the worlds most unreliable source,
that Atari has plans for a keyboard for the Jag. I was old, i.e. already
had kids & a job, when Pong came out. At this stage of my life I regard
myself as a true Atari fan in that I don't believe anything from the
rumor mill, only stuff I've seen with my own eyes, but I have to admit
I smiled broadly & immediately started thinking of trimming my budget
so I could have a couple of hundred bucks & be first in line. It
makes too much sense for Atari to actually do it. I mean there's
C compilers, assemblers, & other languages comming out the Kazoo
for the 68000, the built in ports could handle the equivalent of a
LAN for schools/teaching envirionments, ton of ram, great graphics,
a seperately programable DSP chip, *AND* a price <$150. I think we
are all but forgotten at Atari as a market segment. Given a choice
between a Jag with a keyboard & either a Pentium or Power PC based
Mac, I'd rather have the Jag.

the Atari 2600 is the coolest system for video games around to date...
it has it's own culture and it just plain rocks. if we should revert to
the old 8 bit games and the neat programming the world would be out of the
economical pit it is in and the sum total happines of all people on the
earth would increase 100-fold. why do you think that the 80's were so
care-free? we didn't have all the crazy problems that are here now!
Regan was in office, i bet he had a 2600!

join me in the PFFA! (people's front for Atari)

3119. Hi-res + P/M?

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-05 00:00:00 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <451acq$1uv@erinews.ericsson.se>
Source record: 88141

One thing that I always wanted to do but never did was to create pictures with the hi-res mode (320*200, one colour) and coloured areas created with P/M-graphics.

I was planning on using a raster interrupt program, which for each screen line would read a list with info on x-position, width, colour, and pattern for each player.

I believe the best visual impression would be achieved with a white background and black foreground colour. The black colour would then be used to put hi-res outlining on arts coloured with the P/M-technique. Using only the four players 80 percent of a 320 pixel screen line could be coloured this way. Of course the colour use would be limited, but with the horizontal retrace interrupt changing the colour layout for each line, it should be possible to create some really amazing pictures.

A similar technique is used on other computers like the C64 and the Sinclair/Timex. Monochrome pixels (well, almost) and a map with background colour attributes (typically 40*25).

(This is not only to c.s.a.8, but also to James himself)

Ok, James King is (you are) looking to get rid of his (your) MUX setup.
"Hey, perfect" I thought.

But - from the bit of mail I've gotten so far, I think he gathers that I'm
planning on using SpartaDOS and/or SpartaDOS-X with the setup.

Not true. At least, I hope.

Anyway - now, for the questions:

(1) Do you NEED the "MUX-OS-ROMs" to use MUX? (ie, if I were to use
MyDOS, would I still need them?)
(2) CAN you use MyDOS with MUX?! It would seem so! (Esp. it being a CSS
product ;))

Anyone have experience with MUX setups? For now, I'm planning on this:

SIO2PC serving files to the master (what requirements are there for a master,
btw?, just 64K?)
Slaves off the master, including (at least) one PAL-ANTIC-based XL, and
one Sweet-16-based XL

Will this work alright?

Thanx!!

I think I have a spare copy of the schematics, Email me you address & I'll send it to you.
Just a BTW: The buss is not buffered or anything like you'd find on something like the IBM for instance. It's really only the internal buss signals brought out to the edge card connector. I've found there's plenty of horse power in there for adding chips without having to add any buffering so desinging for it is simple. There are two pages of memory that were neven officially commited to anything after the computers left the factory, $D6XX & $D7XX <read somewhere that $D7XX was reserved for in house testing???>. The convention, which you are perfectly entitled to ignore, is to just decode the upper 8 bits of the address lines & dedicate an entire page to whatever you hang on the buss, even if it's a single chip. This has a tendancy to get some people P.O.ed, but you'd catch flak no matter what you do so grin & bear it :-)
Rick

>I was under the impression that a display list instruction an LMS bit set
>makes ANTIC ignore the DLI bit. I'll have to check my Hardware Manual.
>I'll get back to you on this.

This is not correct. DLI bits are never ignored. You will have two
cycles less time in the horz blank region due to the extra DMA fetch of
the LMS bytes, but that's it.

>>using redefined characters as well...
>
>I mentioned in an earlier post that I was still unsure whether
>this would be faster than hardware scrolling.

It _won't_ be faster than hardware scrolling, but that's not the point.
Hardware scrolling will move the entire line at the same rate, and that
greatly limits the effects you can do. Unless you need all of the CPU
time for something else, character methods will give you a lot more
flexibility, and they can be used in conjunction with the hardware
scrolling so that you don't have to shift every byte.

Bertrand's examples of seeing backgrounds scrolling at different speeds
though holes in the foreground are the kinds of effects that you can't
do with hardware scrolling alone. Same with the example I gave where
you might have a tree in the very near foreground that scrolls across
multiple layers. In this case, it would be neat to have the upper
branches of the tree in a "sky" layer that had no other detail. Thus,
you could use hardware scrolling to move it across. The trunk of the
tree might pass through several layers, and would need to be character
shifted at different rates, and then have the rest of the foreground
masked and ORAed in. Since the trunk is a simple and narrow structure,
there would not be a lot of overhead in doing something like this. The
'depth' gained in doing effects like these would be very much worth the
extra CPU time that character methods take -- unless you don't have the
extra time available.

Source record: 88152

From: per-erik_peterson@asb2.ct.se

Hejsan All!

Is there anyone here who ever had some troubles whith your BB as I have.???
When I start up ex Flicker Term or Bobterm there come scrapsigns in a
mainstreem to the screen. I can type ex ATDTxxxxxxx and when I get conected to
an BBS evrything looks as it used to be. But when I get offhocked again the
scrapsigns come back (in a 300 baud looklike streem again).

This means that my BBS think that someone is calling and keep answering untill
I reset the board and go back to Sparta Dos again. The problem started after an
convent we had in the middle of June. Fredrik Lundholm have been here whith his
BB and modem to see if the problems stopped. Nooooo. I only get other problems
whith his modem and all BB act as I described som lines over this one.

I take the power from my PC. Can this be one reason wy the BB act as it do.??
I have also tested different XE machines but nothing seems to work.

That's a really nice idea; DLIs would make this easier but the only
problem I can see is if the fastest moving lines move more than 8
color clocks in relation to the slowest lines which means that you'd need
do the equivalent of shifting the LMS instruction to the next character in
the middle of the mode line - as I believe this is impossible then it
probably leaves us with character scrolling (or hardware bitmap scrolling)
if we want a big difference in line speeds.

Anyone know of a good Epson compatible screen dump program which will work with Turbo Basic XL? Preferably one that is memory resident and can be accessed with a hotkey. Thanks in advance.

I am posting this message for a friend who does not have Internet access.
If you send me e-mail, I will make sure he receives it. -- Basil
------------------------------cut here-------------------------------------
ATARI ST/8-BIT

ALL SOFTWARE PACKAGES ARE ORIGINALS WITH COMPLETE DOCS, DISKS, AND
BOXES, unless noted with a * which means there is no box. I will refund
your money on any disks or cartridges that do not work.

Best offer applies to all

Atari ST 3.5" software:
E-Z Track MIDI Sequencer (new, unopened).....$6
Personal Pascal *.....$4
ST Key *.....$4

Atari 8-bit 5.25" software:
Atariwriter (cartridge) (new, unopened).....$6
Atariwriter (cartridge) *.....$4
Atariwriter Plus (cartridge) *.....$4
Basic XL (cartridge) *.....$4
Pilot language (cartridge).....$4
Telelink (cartridge).....$4
Turtle Tracks.....$4

I only have an 8-bit Atari. I would also trade for various games, such as
Clowns & Balloons and Spelunker.

The above prices do not include shipping.

Except for trades, minimum purchase is $12 worth for Atari items. The
shipping cost depends on how many items you want, if they have boxes, and
how heavy they are. For items that can be sent with the standard 2 lb. US
mail book rate, shipping is $3. For everything else, I will weigh the
items and call UPS to get a shipping cost for you. I will only ship within
the continental UNITED STATES. No exceptions.

Very few prices are set in stone. The more you buy or the more you
have to trade, the more interested I will be in making the transaction
worthwhile for both of us.

Thank you,
Randall

If you have other computers, I have items for sale or trade for the
following (in order of most stuff to least stuff available):

o Commodore 64 software, hardware, magazines, and books
o IBM software
o Macintosh software (mostly old B&W games)
o TI-99/4A cartridges
o Amiga software and books
o Atari ST and 8-bit software

Check out these lists at my friend's URL -> http://www.rain.org/~basil
------------------------------cut here-------------------------------------
Please send any e-mail to basil@rain.org and include at the top of the
message or in the subject header: "Forward to Randall".

If I ever get a chance to complete GED, it will do this mode and more. The idea, is that it has a kernal capable of changing any nine hardware registers per line. Right now, it runs in 160x200, but an additional parameter set for setting the ANTIC mode could provide 320x200 support and GTIA. Since on-the-fly hardware changes are there, this would also enable the ability to mix 320, GTIA, and 160 modes on the same scanline.

> (1) Do you NEED the "MUX-OS-ROMs" to use MUX? (ie, if I were to use
> MyDOS, would I still need them?)
Yes. you need a mux rom in every slave unit. I have even gotten an 800 as a slave
unit.

> (2) CAN you use MyDOS with MUX?! It would seem so! (Esp. it being a CSS
> product ;) )
yes. sparta will work but it must be modifyed. x will not work unless someone can
burn a new rom or load in a different sio.sys.
>
>Anyone have experience with MUX setups? For now, I'm planning on this:
Played a bit with one before giveing it back. had a 800 and 800xl slaving from a
800xl
>
> SIO2PC serving files to the master (what requirements are there for a master,
> btw?, just 64K?)
The master only needs 64k (booting sparta) or 48k (booting mydos)
The slaves can boot any dos they like. you can set a drive for one slave to boot
from and and another drive for a second slave, etc
> Slaves off the master, including (at least) one PAL-ANTIC-based XL, and

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $100.00 or best offer.

ATR8000 64K CP/M computer, for use with Atari 8-bit computers or Dumb (IBM computer) terminals. Runs all CP/M 2.2 software, supports up to 4 disk drives, any size, any density, 8 inch, High Denisty 5.25 and 3.5 floppies, any IBM compatible printer, modem port for using any RS232C compatible external modem, includes Auto-Term Disk for Atari computers, CP/M 2.2 Master Diskette, several CP/M disks, ATR8000 Manual, MY-DOS master Disk, CP/M Supplement Manual, modem cable, printer cable, original cost $695.00 for the ATR8000 Basic system, printer cable $39.95, Modem cable $39.95, asking $125.00.

Dual Floppy Disk Drives in case with power supply and cooling fan, connecting cable, for above ATR8000 or any IBM compatible computer. Case can hold 4 half height 5.25 floppies, original cost $895.00, Case alone is worth $89.95 at most supply companies, asking $85.00.

BOTH ATR8000 & Dual Floppies in case, $150.00.

ATR8000, as above, only with Co-Power 88 installed. I bought this from a guy for $375.00, does NOT have the Co-Power 88 Boot Disk, needs a copy. The guy who said he was going to send me a copy never did. Need to recover my loss on this unit.....$350.00

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes manual, power supply, original cost $179.95, asking $75.00.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $175.00 for the entire package.

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Send all inquiries/offers to: admiral@freebbs.com via Internet E-Mail.

Will consider trading for: trak AT-D4 Double Sided Disk Drive.

Could someone let me know what the latest version of PC Xformer is as of you reading this.

I have v 3.0a I have a feeling a newer, more capabable version, maybe with more bells and whistgle, a better way to change disc images, would be available (now that's a run on, eh?)

Also I thinkm my version os messed up, I can't change the disc images from the usual way, but everything else works.

Eric

3148. SYNCROMESH for Indus

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-08 00:00:00 UTC
From: ai542@FreeNet.Carleton.CA
Message-ID: <DG52Mz.5xA@freenet.carleton.ca>
Source record: 88070

If finally found the utility put out by Indus that activates the high
speed option of their drive. I tried it but I have not seen any increase
in speed. This was tested by performing sector copies with and without
the Syncromesh utility being activated - also with different types of DOS.
Noteably, even using DOS XL didn't provide the speed increase that was
touted by Indus.

According to what by now would be classed as "legend", the initial code
for Syncromesh had "buggy" code, but was never rewritten.

Anyone else have experiences with this utility?

3157. Professionally produced SIO2PC devices - Lets do it

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-09 00:00:00 UTC
From: classics@nacs.net
Message-ID: <45c2tn$7vt@tracy.nacs.net>
Source record: 88079

Hi everyone :)

Awhile back I posted a plan to have a number of professionally produced SIO2PC/APE devices made. Well, lots of stuff conspired against me, including a lack of time and a system crash in which I lost the e-mail addresses of everyone who pledged support.

Now that I have time for it, I would like to hear from everyone who would be willing to commit to purchasing one when production is done. I need at least 20 pledges to make a project a reality.

If someone can find the original article I posted (lost here) and repost it that would be great. I think the price I quoted was $30, I have the list of production costs here somewhere and will confirm this price later in this group or in e-mail to interested parties.

In short these will be professionally produced. Double sided PCB drilled and plated through, 2 chip MAX232 design, female DB25 connector for use on PC or MAC (w/ appropriate modem cables), case, etc.

As soon as I have the 20 units pledged, I will front all the money for the prototyping PCB run and parts. When the order for the large run of plated through PCBs and cases is ready, I will make a call for checks and the project will become reality.

I REALLY want this project to happen this time. I think everone having to build a device themselves, or having to pay $50+ for someone to spend hours hand building one when there is a obvious demand is a bit odd. Therefore I will offer a ** FREE ** registration of the APE package to each and every person who purchases one of these first 20 units. (sent at the time the units are shipped).

Please repost this message to any FIDO echos, or local Atari BBS's you have access to. To be placed on the pledge roster you need to contact me.

You can contact me by e-mail at 'classics@nacs.net' or 'dh395@cleveland.freenet.edu'. If you do not have access to internet e-mail please feel free to call me at 216-237-5308 to be placed on the list. (PLEASE leave a message, as I am rarely home anymore).

Thanks to everyone who e-mailed with pledges in the last attempt, I would e-mail you all personally but I lost the list of address :(

Thanks!

Steve

I haven't tried the program yet, but wouldn't it be more elegant instead of
resetting this parameters to the standard ones just set them to the values
they had at the moment when the program have been started ?

Just the question :)

Thanks.

I should have posted this before - Rick Cortese was kind enough to help me with this problem, and told me the standard way of putting the Start At and Init addresses into the object file from MAC/65.

3163. FS/T: Atari 8-bit computer software and hardware

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-09 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <45b3bf$j39@ixnews6.ix.netcom.com>
Source record: 88085

updated 10/09/95

I have the following Atari 8-bit software and hardware for sale or
trade.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Postal Service. The shipping
cost depends on both the weight of the package and the distance
that it is traveling. Buyer has the choice of either first class
or parcel post (which is slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 6.00 ATARIWRITER
$ 6.00 BASIC
$ 6.00 GALAXIAN
$ 7.50 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they

are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$25.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$45.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$35.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$59.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

When I got my Jag (and I was one of the loyalists/suckers(?) that
lined up first for that, during the test-marketing phase) I thought the
same thing. I read the releases about the neat chips in it, and thought
how wonderful it would be to program such a machine!
But, as you said, it makes waaaaay too much sense for Atari to
actually put out a keyboard for it. [sigh]

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <146637@cup.portal.com>
Source record: 88095

Bill, don't know if you care since you can't run it<g>, but I finally
booted up XF25 & did some jerking around. Another while I was resting,
but I just renamed a OMNIMON ROM image I had on my clone to ATARIXL.ROM<?>
& booted the emulator & sure enough, fast floating point routines &
built in monitor all there. It sector editor evem seems to work from
the monitor, matter of fact, I couldn't find anything that didn't.
Speed increase with basic was only about 10% but it eliminated most
of my gripes about slow keyboard response. I can't seem to type faster
then the emulator anymore. This is on a 33 MHz 386 with 128k cache.
Speed trials for a simple basic loop took 66 tics vs 115 on a real
Atari. I also renamed my ASM/ED ROM to ATARIBAS.ROM, much more practical
for me since my burner is on my clone & it booted flawlessly.

Space and lack of capacity are the reasons the amiga is not set up.
Lack of desire or operability are the reasons the Sinclair, TI, and
Apple // are not hooked up.

I'm considering setting up the Amiga, though, for a real 80 column screen.
FlickerTerm is ok, but not the clearest of displays.

>Anyone else have experiences with this utility?

Yep. i have it here (don't ask me to find it). It works great. True the rom code of syncromesh is buggy but indus got around that by downloading to the drive the code that would run syncromesh properly. The syncromesh utility disk boots dos then loades the drive with the required code. Then it works fine. Remember you must format a disk with syncromesh enabled to get the high speed.
SDX has the syncromesh code built in. The drive must be programmed every time it is turned on.

>Sycncromesh?

That's exactly right. You have to format the disk with the skewed
sector layout or you don't get any gains.

Overall, its probably better to use Sparta DOS X as the code is
compatible with both Indus drives and Sparta drives.

>Heck, all I've ever owned is classic Ataris. [text deleted] So I do
>all my word processing, spreadsheet analysis, and programming on an old
>800XL.

REALLY????

I have Visicalc, Atariwriter+ and Synbase Plus which covers most of the
serious things you do at home. But on a 40 column screen and slow floppies
it's really a pain.
In Visicalc you could see at most 4 columns on your screen.
Word processing _needs_ 80 columns!
Once I entered a 500 record database in Synbase. The first 200 record went
well. but then, each time I enterd 10 records or so, I had to wait several
minutes before I could go on entering.
No, my 130XE is only for gaming. For the serious stuff I moved to an 1040STF
which I upgraded to 3 Meg and I added a removable Syquest 270 MB harddrive
(14 ms access time!)

But I _loved_ my first ATARI 400 and programming in assembler !!! Perhaps
that's why I never sold my stuff and kept everything.

Steve, I think he was refering to the 1 chip MAX232 version. I believe the DOCs for it are in the 3.17 version for sure.
BTW: I've only had one cable where somebody reported they thought it had failed. It happened to be a 4049 version & as soon as I hooked it up, it worked fine. There is just nothing in there to burn out with the componets that are in it without putting it together wrong. It's somewhat academic since I wouldn't advise anyone to make a 7400 (or 4049) version vs the 1489 version, but IMO: Problem is with the kit builders vs any design. Since software started sucking talent from soldering the ability level of kit builders has dropped. I would love to hear from anybody with a failed cable or kit & would fix it for them for postage *but* there will probably be a post in the sig from me on just what was wrong with the cable. I know you're thinking about doing a kit form. I was lurking during a conversion between two people in the industry & the more experienced one was saying stuff like, "Price your kits so high... Up front make the cost of a kit + repairs so high people will opt for the finished... you'll lose money if you price kits with normal markup because of returns.." It was really a frightening experience<g>!
Understand, I am behind your efforts for two reasons.
1) High quality SIO2PC cables for those who can't make them.
2) Offering kits! People learning how to solder can only help!
Once again, the TTL & CMOS versions of the cale only have 1 input from the IBM serial port. This is run through a resistor so the amount of current you could get through it is less then 1 mamp! This is not mear enough current to burn something out even in a dead short. The circuitry I put off the TTL logic is an approximation of what's on a 1489 if you have the data sheets.
Rick

Funny, that's the part of his post I disagreed with most!

Words don't need 80 columns unless you're simultaneously worrying
about the way things look on an 80-column screen. And unless you're
trying to use Turboword80 (what a horrible name for a slow program!),
word processors don't require much speed.
I used my 1200xl and Atariwriter(+) for all my word processing until
just a couple years ago.

I started moving away from doing serious work on the 8 bit about 3
years ago, when I needed to print graphs of my spreadsheet results.
Visicalc wouldn't do it, and I couldn't find anything that could give
the quality I wanted.
Then I needed 80 columns, not for word processing, but for modeming.
Ice-T and Flickerterm weren't around, and the other options either
wouldn't do vt100 (Bobterm w/XEP80) or couldn't keep up with my
2400bps modem (kermit and others). For a while I was bouncing between
BT and kermit depending on what I was doing.

After that the driving forces became disk size/speed and compatibility
with the rest of the world. As an engineering student, I finally
needed something more. I decided it would be better to pay the extra
money for both, rather than get a black box and just get one of those
attributes.

Now when I get time to do Atari work, it's usually to try to smooth
the compatibilty problems between Atari and the rest of the world.

(Now Unix is my first choice of systems, but the Atari sure isn't just
for games!)

>REALLY????

Heh. Far be it from me to tell you what computer you need, but yes,
indeed, there are some of us who use /only/ the Classic Atari for our
home computing needs.

>I have Visicalc, Atariwriter+ and Synbase Plus which covers most of the
>serious things you do at home. But on a 40 column screen and slow floppies
>it's really a pain.

(Where Synbase Plus = SynFile+, I assume.)
Visicalc isn't exactly the latest spreadsheet program for the Atari,
though. Heck, I use SynCalc to do my home spreadsheets and have no problem
with it. That's probably because, 1) my home spreadsheets are rather
small - maybe 12 columns by 25 rows or so at most, and 2) I'm used to
scrolling around spreadsheets because at work, even with Windows' scaleable
fonts, I have to scroll around the HUGE sheets we have there (or put them
in tabs and flip back and forth, which is about the same) (one of our
spreadsheets is 32 MB).
For word processing, it really isn't necessary to see 80 columns
all at once. I just set up AtariWriter to allow for 80-column lines and
let it scroll as I type (ie, 40 columns visible at once, 80 columns total).
For database management, i use SynFile+. It works for my
databases of Traveller materials (an RPG with hundreds of supplements, books,
adventures, etc.), CD's, and Atari programs/hardware. Granted, I don't
do any single database as big as the 800 record one you spoke of, but
in my experience Synfile+ hasn't slowed down very much at all when entering
records.

>In Visicalc you could see at most 4 columns on your screen.

Depends on how big you make your columns, don't it? :)

>Word processing _needs_ 80 columns!

See above for the answer to this.

>Once I entered a 500 record database in Synbase. The first 200 record went
>well. but then, each time I enterd 10 records or so, I had to wait several

>minutes before I could go on entering.

Oop. i mis-remembered. only 500 records? Hmm. Well, even so,
my largest is only perhaps half that big.
But then, how many people need 500 record databases at home?

>No, my 130XE is only for gaming. For the serious stuff I moved to an 1040STF

Only for gaming, eh? Well, at least that's something.
It is possible, and even desireable (at least to some of us) to use
the Atari for such serious applications as word processing, database
management, spreadsheet analysis, graphics production, telecommunications,
programming, and music composition.
The Atari 8-bit line of computers, as always, is far more than
a games machine.

3198. Atari 8-bit CD

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-11 00:00:00 UTC
From: "Ernest.R.Schreurs" <ernest@pi.net>
Message-ID: <45hc0p$kff@neptunus.pi.net>
Source record: 87920

We have been working on creating a CD for the Atari 8-bit for about two years now. We plan on producing a very limited quantity by mid October. Does a CD for the 8-bit make sense? It sure does.
What we are doing is collecting all the public domain and shareware programs that we can put our hands on. Then, we use SIO2PC to create disk images of them. Thus, all disks are converted to the ATR file format used by SIO2PC. By now, we have some 1500 disk sides converted this way. Now all we have to do is put these on a CD, and guess what? If you have a CD-Rom player on your system you can choose from 1500 disk images to load into SIO2PC, APE, or better yet straight into the PC-Xformer or ST-Xformer. (In order to support the ST-Xformer, we will have to store all images in the XFD format too, but what the heck, lots of space on a CD).
We hope to have the umich archive converted into ATR files too before we start producing the CD's. Since the CD's will be produced on a CD-writer, quantity will be limited by time, it takes a couple of hours to burn one CD, and we have to burn each CD individually.
Anyway, now here is our question. We currently have no plans yet to sell these CD's anywhere but here locally, in the Netherlands, and Germany. We were wondering how many of you out there in Cyberspace would be interested in this CD? We think the CD would cost between US $30 and US $35, plus shipping. We are not yet taking orders, but if enough people respond, maybe we will be persuaded to work something out to make these CD's available to everyone. The major problem holding us back is the method of payment, since I believe in the U.S. it is illegal to send money in an envelope.
Post your reaction or send an E-mail to ernest@pi.net

>to program this machine, but it really is much different from the others.

I'm glad to hear it.
Although, BusinessWeek (a magazine I respect quite a bit more than
Newsweek) had an article this week about the latest gaming systems. They
not only gave some rudimentary stats (price, add-ons available, etc.), they
also played them and let some kids play them. They had lots of good stuff
to say about 3D0, Sega Saturn, and Sony Playstation. About Atari, it was
mostly negative. Among the negatives were the lack of cartridges, the
lack of a built-in CD player (although it was noted that a CD player is
available now), and Atari's "spotty marketing history," which was cited
as a reason for the dearth of carts.
On top of all that, the Jag CD unit that was sent to Businessweek
by Atari /did not work/! Sending faulty product to such a prominent,
respected business magazine is /not/ good.
Fortunately, few videogame players read this mag, so maybe
Atari can still get people on their bandwagon. But, the folks who run
the companies who make carts probably do read Business Week, and this
may give them pause...

I didn't know Autoduel had come out for the Atari 8-bit! Hmmm...
I'll have to try to find that.
I wish Earth Orbit Stations (Electronic Arts), B.O.L.O., and
Sabotage (all Apple][games I enjoyed) had come out for the Atari8.

3201. FS/T: Atari 8-bit software and hardware

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-12 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <45iheq$5bk@ixnews2.ix.netcom.com>
Source record: 87923

updated 10/12/95

I have the following Atari 8-bit software and hardware for sale or
trade.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Postal Service. The shipping
cost depends on both the weight of the package and the distance
that it is traveling. Buyer has the choice of either first class
or parcel post (which is slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 6.00 ATARIWRITER
$ 6.00 BASIC
$ 6.00 GALAXIAN
$ 7.50 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they

are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$25.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$45.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$35.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$59.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

3202. CX8139 disk for CX85 keypad

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-12 00:00:00 UTC
From: mpook@freenet.npiec.on.ca
Message-ID: <DGCBoC.Cu1.0.freenet@freenet.npiec.on.ca>
Source record: 87924

I was backing up some of my original disks the other day and
accidentally erased both the original and backup of this disk;

-----The Atari CX85
-----Numerical Keypad Handler
-----Master Program Diskette
-----CX8139 (c)1982 Atari, Inc.
-----All Rights Reserved.

I have an archive of the files on the disk, but unfortunately
I do NOT have an DISKCOM of the BOOT VERSION of the CX85 handler.

I would appreciate it if someone would make a DISKCOM of the CX85
disk and attach the file CX8139.DCM to an E-Mail message to me.

Hi there (again).

I think it would be a wonderful idea, plan on selling me one.

It is not illegal to send money in the US to the best of my knowledge
(although it may be, now days...they are passing a bunch of laws to
"prevent drug transactions", etc), but there is a fairly good chance of
getting it stolen, as many of our postal workers are on the low end of the
scale (they are murdering each other).

The more CD's available for the Atari, the better!

Yes, I've been very happy with Synchromesh on my Indus also, but
the driver only works with DOS XL. I know SDX supports Synchromesh, but
I really wish there was a Synchromesh driver that worked with the disk
baased versions of SpartaDOS. I prefer SpartaDOS to DOS XL, but I hate
giving up the speed of Synchromesh!

>also do *most* of the xmas shopping so it comes down to this: It doesn't
>matter if a consol has 1 gig of ram, CD ROM, 20 games bundled with it,
>SVGA graphics, ... for $201! It will be overpriced for a xmas/birthday

In my own experience as a gift giver and as a recipient of such
gifts when I was younger, what you say is true. In our family, we set
a limit of $50 per gift to all non-direct relatives (if that is the
proper term - ie, brothers, sisters, parents, children get more spent on them
than do cousins, in-laws, neices, nephews, etc.). This not only rules
out videogame consoles, it rules out most game carts these days!
And as you said, even in the case where "It's for the family," the
amount spent on a single present is rarely more than $200.
So, mebbe Jag has a chance.

>like Saturn & Playstation come out. I hope your subscription to Business
>Week doen't run out before the results of the xmas season are in <G>.

Nah. I have a two-years subscription. I love that magazine. :)

I have pondered this, too, now that I am programming in assembler.
It seems a rather obvious thing to put in there. And it's such a bother
to move the value to the accumulator, /then/ put it on the stack.

3212. Video switchbox

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-12 00:00:00 UTC
From: cmwagner@gate.net
Message-ID: <45jroa$1304@news.gate.net>
Source record: 87934

I am looking for some sort of video switchbox, with various inputs and one or two types of output, what the device does is takes the various inputs (stereo AV jacks, RF modulated composite, 75 ohm coax) and allows you to select which input you want to go on the output, which would be stereo AV jacks or 75 ohm coaxial. Has anyone heard or seen of such a device? If not, I need to find circuits that will convert the three various signals into a common signal, I need to know how to seperate all of the lines, demodulate, etc all of the signals into stereo AV jacks, specifically for coaxial and RF modulated composite signals. I have alot of various devices that I use on my TV set, several game systems, VCR, etc... and since my setup is so odd I cannot use my VCR and my Sony PlayStation at the same time (they are both fed in the stereo AV jacks), and the video quality is also degraded for every device I have connected via a serial coaxial line. So this is my best solution, and it is something that will work for me. Any help will be greatly appreciated, direct me to books, people, companies, anyone...

3213. Free Atari for postage

Source record: 87935

I have:
Atari 800
810 drive
410 tape
Gemini 10X printer
lots of disks
several tapes
a couple of cartriges (basic, bounty bob)
original VISICALC
Wico (2) joysticks
lots of copied documentation.
all boxed and ready to go - last person who wanted this failed to send me postage in advance (that's all I ask).

Free to anyone who will pay postage. It goes in the garbage (I am moving) if I don't hear from a serious person soon.

The estimated cost to Miami from Tampa was $18 UPS or Parcel Post $57 1st class. I have done all the leg work, I am not going to stiff someone. Anyone who wants to call and talk about it, (813)654-3599.

Message-ID: <ext287-1310951427080001@198.112.81.60>
Source record: 87937

The UMICH archives contain an intesting program known as SIOCOPY that has a simpler interface cable then SIO2PC, and supposedly transfers files off an 810 drive direct to PC via parallel interface.

First off has anyone built/tested the SIOCOPY program and cable? If so are the disk images created compatible with Xformer?

Secondly, since Rainbow has now appeared, is anyone willing to write an SIO2MAC script - so one could do all their file transfers purely on a Mac platform?

Sorry Bill

A) don't have full internet access

B) do they have teletext in the USA (textpages they send along with the TV
signal)? Well, all of Europe has this. We had NBC Super Channel overhere
and they had a couple of teletext pages that told us how to get all kinds
of things via Email. Unfortunately the swap a new private Dutch TV station
in and NBC super Channel out. (not only do I have to miss these pages, but
I also have to miss REAL Personnal with Bob Berkovits (or whatever) and ever
lust-full looking Dr. Joyce Brothers. :-) )

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS and if I had access, I probably wouldn't understand a thing. I only
finished two programs in all the time I own my 130XE (since it became available
overhere)

How much do they each weigh? I've heard about prices like 500 guilders overhere (they will become available next week. If the sales dudes didn't lie to me a couple a weeks ago). Even if the exchange rate goes up to fl.1.75 per dollar, US$200 is still only 350 guilders. And the carts would cost 50 guilders.

s >> Can I use an internal???
s >
s >No internal Zip drives are being sold yet, and it's not advisable to
s >remove the Zip drive from the external case.

Atleast this means that I don't have to tell the bozo that their are other interfaced than those PC-busses.

s >I've gotten it to work under SpartaDOS with a borrowed Black Box.

Is it just like using a standard hard drive or did you have to do certain things to get the ZIP drive to work?

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS should I decide to order drive and carts in the USA, where can I get them via mail order? How do these things get their power?

k > or How much are the last BlackBox setups going for?

Howdy Bill

Their are two scenario's I could come up with that I'd like that use MUX's to
speak to each other:

A) 1 XE running BobTerm/Zmodem to get a QWK package.
(1 XE running UnARC to turn an QWK package into *.DAT files)
1 XE to run whatever software, since the two things above take much time
bore the hell out of me.
(1 XE to create the .NDX file PabQWK needs)

computers within brackets are optional. Coincidentaly I have 4 XE's, but
my second XEGS was DOA and still is. I guess the above wouldn't really
work because of too much disk access (maybe with a Hard Drive???) and
one looses the RS232 port of the BlackBox when MUXing.

B) Multi screen, multi computer game. You get "surround vision".

In the March/April 1995 issue of Atari Classics was a CSS ad. No BB's
mentioned. MUX (1 master/2 slaves (sounds kinky, doesn't it?)) sells for
US$ 149.95. Extra slaves are $49.95 each. Add shipping ($5 in the USA).

Don't know about MIO2's. Contact Bob Puff on those BB's

76702.1076@compuserve.com

If you do, please mention that we need MyDOS 4.60 and BobTerm XE....

k >8bit.
k >
k >URL: http://zippy.sonoma.edu/ kendrick/nbs/ados
k >
k >Thanx!! (plea plea plea)

Sorry Bill

A) don't have full internet access

B) do they have teletext in the USA (textpages they send along with the TV
signal)? Well, all of Europe has this. We had NBC Super Channel overhere
and they had a couple of teletext pages that told us how to get all kinds
of things via Email. Unfortunately the swap a new private Dutch TV station
in and NBC super Channel out. (not only do I have to miss these pages, but
I also have to miss REAL Personnal with Bob Berkovits (or whatever) and ever
lust-full looking Dr. Joyce Brothers. :-) )

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS and if I had access, I probably wouldn't understand a thing. I only
finished two programs in all the time I own my 130XE (since it became available
overhere)

k >Damn.. gotta run..

Yeh!! Tell 'em Bill. I've got a 130XE, a 800XE and 2 XEGS machines (one is
in comma), maybe I'll buy a 65XE soon. (both the 800XE and the 65XE share
the "new design/64x4 RAM chip" 130XE motherboard, so with two extra chips
(256x4 preferred, but 64x4 would be OK for now) and a CO25953 Custom-PAL each
I'd have three 128k or more XE's.)

I'd rather spend a lot of money on some classic Atari hardware then let
something Intel into my room.

w >800xl or a memory module for the 600xl; have any for sale?

While in BASIC type BYE. You'll get into the selftest. Select and start the
memory test. I guess it shows 8 blocks for 16k and 48 blocks for 64k.
(if you enter the test with BASIC disabled (forgot how to. I guess booting
with OPTION presses and all drives switched OFF should work) you get 8 extra
blocks.

American TechnaVision has a 600XL to 64k memory upgrade.

m >From: moellerw@hookup.net (William Moeller)
m >Subject: Floyy Board by CSS
m >Date: 27 Sep 1995 19:21:17 GMT

Howdy William

I too own both a BB and FB.
And I too had my share of problems, but most are not related to the FB.

- I let Bo Schreurs order me a BB. At the same time Bo ordered an FB for somebody else. I sometimes call CSS-BBS. Bob asked me if it would be mine. I said yes. Major communication error. Bob tide bth together. Bo called me. OK I'll take both.

- It came with a 110V/60Hz adaptor. Bob forgot to tell me, that he had switched the plug (and ofcourse the position of the wires) I cut off the plug, connected it to the switched PS I had bought especially for this purpose according to the numbers on the adaptor.

- switch 130XE on. Black Screen. Beep Beep. Whoops!

- Back to Bo. Called Bob. It's the OS EPROM. Got the burn file (??) form Bob via modem. Bo's brother picked up the BB/FB and before he arrived home (by train), I already send Bo the burn file.

- One of the pins of from the EPROM sat outside the socket, maybe this caused the beeping but I probably shorted the thing (see above)

- When it came back, it still wouldn't work on the 130XE. Tried it on the 800XE. Worked great.

- Went looking for replacement CPU. A fellow I know had a couple he had already tested. Replace the CPU. My 130XE works with the BB/FB

- Got a green screen latter. Toke me a YEAR to find out my Atari PS was dementing.

- O yeh. Had the switching PS looked over once. Voltage would drop to zero every once in a while (especially after I just booted up or in the first halve hour afterwards). It came back, but now everytime I put a floppy in the 1.44 meg drive (it sits in the minitower that came with the switched PS (it was cheaper to buy the minitower then to buy a separate switching PS)) or if I tapped the tower, dropped a floppy on it, it would just STOP. Asked a techno dude. "warm up the soldering iron and re-solder every connection" Haven't had a power failure since.

- A while ago the FB made both drive mechs attached to it spin at once. Why? I don't know. I seem to have shorted my computer somehow and ever since

that time my computer can lock up at the silliest (sp?) moments.
And it was when I still had the old brick power my 130XE (it not only dropped the power to 4.3x VDC, it also raised it to 6.xx and even 7.xx VDC.)

- I bought the BB printer spooler second hand but unused. I love it.
(ofcourse I reversed to wires, but that's where Atari Classics came in handy they ran a story on how to build your own BB printer spooler.)

- And a put a 2MHz 68B21 in, but I still have to see the advantages of that.

Bottom line: I never really had serious problems like you have. And I love the BB/FB It's a pitty these things only go up to 19k2 bps.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS Mike Hohman seems to be back in the land of the living. Try contacting him on the Sweet 16 case. But if your screen turns green and eventually you loose IO, I'd check the voltage I was getting. I too was suspicious but it WAS the reason. If I wouldn't have checked, my 130XE might have been history.

From: mathniss@link.xs4all.nl
Message-ID: <45m91e$fq@link.xs4all.nl>
Source record: 87952

Howdy folks

I've found (OK Atreju told me) the address that controles the sector size.
Ofcourse it would be nice if MyDOS could also handle these sizes.

The addresses are: 725 and 726 ($2D5 and $2D6) DSCTLN

(page 208, Mapping the Atari...revised edition"

Atreju also told me that there is a way to get the 6551 (used in RS232's like
the BlackBox) to do 57k6...

Al we need is to get Bob Puff to reright the drivers in the BB ROM

Source record: 87953

Hello:
I have a 65 XE atari computer,a XMM 301 modem (300 baud), and a XF551 drive, I bought an account from DGSCA to connect my atari to inernet,configure it as the internet providers told me, but when I use the dialup service, the modem don't detect the carrier tune, and the READY lights very dim, The modem Works fine in Atari-atari connections, so I don't know what is wrong, the only comunications program I have is the XE term.

I could download atari programs in my PC, but the PC atari file transfer programs doesn't work, they only write 1 sector (i used Myutil, sparta read, anadisk, etc ..).

What can I do?, I love my 65XE and Hate see it doing nothing.

Ah, Greetings form Mexico to all atarians, and sorry for the poor english.
Mariano.

> I have pondered this, too, now that I am programming in assembler.
> It seems a rather obvious thing to put in there. And it's such a bother
> to move the value to the accumulator, /then/ put it on the stack.
>

It's even worse if you want to write reentrant code that PRESERVES the
contents of the Accumulator while still pushing the register. Consider
the reentrant PUSHX macro below:

```
STACK=$0100

PHA
PHA
TXA
TSX
STA STACK+2,X
TAX
PLA
```

This is a seven instruction sequence that accomplishes what could be done
in a single machine cycle. This gets even more complicated if you're writing
a PUSHY macro.

Ho hum.

I haven't tried the SIOCOPY program, but I do have an STXformer
cable & I'd bet they are equivalent. At least for the STXformer, I've
used it with at least two different programs, one of which just uses
the 1050 as a ST drive. It works fine in both cases, but it's a no
parts design that people charged $25 for at the time. You really
don't want to use a parallel printer port to simulate a serial
cable unless you are really desperate. I've done sillier stuff myself,
but it makes a lot more sense to use a serial port for serial communication.

IMHO: The only time you need stuff like [PHX, PHY] is when you have interrupts occuring. It probably wasn't inportant for the small systems that were around at the time. Things changed with the 800 since you have interrupts occuring all over the place. For instance, let's say you just wanted to implement something like a Hayes compatible modem with a 6502 doing the 'Smart' part. You might only have one level of interrupt, when whatever serial chip you're using signals 'byte available'. You'd then be able to just do something simple like PHA, LDA SERDATREG, STA BUF, STA FLAG, PLA, RTI. May save the processor status also, never had a SBC like a Kim or Challenger or AIM to program on. Even on an Atari you only have to save the registers you use. For instance, in a DLI if you just use A,Y then they're the only ones you have to save. It's all a little academic now; if you really want these instructions you can just buy the 65816 board to upgrade.
Rick

>

Well, that's pretty much what I meant when I referred to the original 6502.
Unfortunately for us, Atari didn't put 65c02s in most (if any) of the 8-bits.

Wish they had.

-Michael Ellis

Thanks to those who replied. I got a call from a person here in Tampa. He was first to call, so I have committed the stuff to him. The person who called from area code (602), you were only about 30 minutes behind him.

Subject: Re: SIO2PC, SIOCOPY, and maybe one day SIO2MAC?
Organization: The Portal System (TM)

I haven't tried the SIOCOPY program, but I do have an STXformer
cable & I'd bet they are equivalent. At least for the STXformer, I've
used it with at least two different programs, one of which just uses
the 1050 as a ST drive. It works fine in both cases, but it's a no
parts design that people charged $25 for at the time. You really
don't want to use a parallel printer port to simulate a serial
cable unless you are really desperate. I've done sillier stuff myself,
but it makes a lot more sense to use a serial port for serial communication.

>Steve, I think he was refering to the 1 chip MAX232 version. I believe the
>DOCs for it are in the 3.17 version for sure.

I was not aware there was a 1 chip version with the MAX232, I will check
it out. No harm done since I havent even had the prototypes made
yet.

>BTW: I've only had one cable where somebody reported they thought it had
>failed. It happened to be a 4049 version & as soon as I hooked it up, it
>worked fine. There is just nothing in there to burn out with the componets
>that are in it without putting it together wrong. It's somewhat academic
>since I wouldn't advise anyone to make a 7400 (or 4049) version vs the
>1489 version, but IMO: Problem is with the kit builders vs any design.

As I said originally its difficult to tell, since I have far less experience
designing circuits than you, if the poor success rates Im hearing are
due to faulty construction or real faulures.

I was quite careful building my MAX232 cables, as the cost for the
MAX is quite high, but I cant say I was so careful with the 7400
version.

>Since software started sucking talent from soldering the ability level
>of kit builders has dropped. I would love to hear from anybody with a
>failed cable or kit & would fix it for them for postage *but* there
>will probably be a post in the sig from me on just what was wrong with the

>Up front make the cost of a kit + repairs so high people will opt
>for the finished... you'll lose money if you price kits with normal
>markup because of returns.." It was really a frightening experience<g>!

Once the PCB's are drilled and plated, assembling the thing is really
a trivial experience. Just sockets, a rs232 connector and the atari
SIO cable.

>Understand, I am behind your efforts for two reasons.
>1) High quality SIO2PC cables for those who can't make them.
>2) Offering kits! People learning how to solder can only help!
>Once again, the TTL & CMOS versions of the cale only have 1 input

>on a 1489 if you have the data sheets.

Ill look over the 7400 cable I have to see exactly what the problem is, from the durability level you describe it must be a broken connection or some other physical thing.

Also, please send me a copy of your new design. Can these 1 chip versions actually handle 57.6k bps?

Thanks

Steve

Someone was on here a few weeks back who said they were writing
an SIO2MAC program. I hope he's still around!!!

3242. ATARI EQUIPMENT MUST SELL!! IT SAYS Make Offer, REASONABLE OFFERS ACCEPTED!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-14 00:00:00 UTC
From: STARFLEET SOFTWARE <103002.2442@CompuServe.COM>
Message-ID: <45njsm$6b6$1@mhafm.production.compuserve.com>
Source record: 87964

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $100.00 or best offer.

ATR8000 64K CP/M computer, for use with Atari 8-bit computers or Dumb (IBM computer) terminals. Runs all CP/M 2.2 software, supports up to 4 disk drives, any size, any density, 8 inch, High Denisty 5.25 and 3.5 floppies, any IBM compatible printer, modem port for using any RS232C compatible external modem, includes Auto-Term Disk for Atari computers, CP/M 2.2 Master Diskette, several CP/M disks, ATR8000 Manual, MY-DOS master Disk, CP/M Supplement Manual, modem cable, printer cable, original cost $695.00 for the ATR8000 Basic system, printer cable $39.95, Modem cable $39.95, asking $125.00.

Dual Floppy Disk Drives in case with power supply and cooling fan, connecting cable, for above ATR8000 or any IBM compatible computer. Case can hold 4 half height 5.25 floppies, original cost $895.00, Case alone is worth $89.95 at most supply companies, asking $85.00.

BOTH ATR8000 & Dual Floppies in case, $150.00.

ATR8000, as above, only with Co-Power 88 installed. I bought this from a guy for $375.00, does NOT have the Co-Power 88 Boot Disk, needs a copy. The guy who said he was going to send me a copy never did. Need to recover my loss on this unit.....$350.00

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes manual, power supply, original cost $179.95, asking $75.00.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks,

valued at $25.00 each. Asking $175.00 for the entire package.

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Send all inquiries/offers to: admiral@freebbs.com via Internet E-Mail.

Will consider trading for: trak AT-D4 Double Sided Disk Drive.

DO NOT REPLY or Email if all you are going to do is make stupid comments...

If you do NOT LIKE the PRICE I POSTED, as it says: MAKE REASONABLE OFFER!!!!!

If yu 8-bit Atari users don't want this equipment fine, I'll just melt it all down..... I have to GET RID OF THIS STUFF!!!!!

How funny. Zip tools are only available for Mac and Windows, AFAIK, how
shall one use them sensibly under Linux, TOS, AmigaOS, etc.?

The question remains: what does a program have to send to the ZIP drive to
change the write protection of the media?

-Texas Instruments Joysticks $3.00 min

-Texas Instruments Speech Synthesizer $8.00 min

-Wico Command Control Joystick $3.00 jschloss

TRADES:

I am looking for R/ER/UR carts and a few U□s for
the Atari 2600 and Colecovision only!

HERE ARE THE RULES:

1. This auction will end on Sunday, October 14, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject should be SWAPMEET BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.50 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $8.00 and $15.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee, no warranty and no refunds
on anything purchased from this auction. Most of the
cartridges have been tested and do work the same goes
for many of the systems. However, cartridges for systems
which I do not own cannot be tested and neither can
systems which have no cables.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: jrm8248@u.cc.utah.edu

3247. The Atari Connection BBS -- to be reincarnated!

After much thought and deliberation, I've decided to reincarnate the
Atari Connection BBS..

It will run as a muxed slave (that means the mux is staying with me,
Bill Kendrick <grin>) and will contain EVERYTHING (and more) from my
Atari CD and ftp site.

The BBS will also contain messages pulled from comp.sys.atari.8bit,
and the Fidonet atari echo, and a few other select newsgroups.
Otherwise, the board will probably not contain any of the normal Pro!
networked bases.

As of this writing, I have other 500meg of hard disk storage and over
200meg of 8bit files.

Stay posted to this newsgroup for details!

In a herculean <grin> attempt to reincarnate the Atari Connection BBS,
I'm finding myself needing another large capacity SCSI or MFM based hard
disk(s).

Anybody have such beast(s) for sale/trade, please contact me ASAP.

The BBS will go live once I get hardware back from Bob Puff.

3250. Re: Antic Music Processor

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-14 00:00:00 UTC
From: lashower@netcom.com
Message-ID: <lashowerDGG4I0.Eyt@netcom.com>
Source record: 87972

lhaus@Mail.ff.cc.mn.us wrote:
: I was wondering if anyone has run the ANTIC MUSIC PROCESSOR on an
: 8-bit ATARI emulator.
: Is the registered version required to achieve total success or will
: the shareware version perform adquetly?

I also tried running AMP (The Antic Music Processor, not Phil Price's Advanced Music Processor) on the latest shareware version of PC-Xformer and have found the following problems:

1) Music plays back at an incorrect speed
2) DLIs and keystoke entry is "weird" using the music editor screen

#1 makes perfect sense: AMP uses a timing loop (via code, not an IRQ) for playback speed. #2, on the other hand, seems like AMP is doing something that PC-Xformer definately does not like. The music editor screen does a number of nifty DLI timing tricks to get the display to work correctly...

If someone has tried using AMP on the latest registered version of PC-Xformer and has found it to still work incorrectly, maybe I could send the source code to Derek so he can track down the problem. Anybody out there know if Branch Always Software is into that sort of thing?

From: mstatz@cei.net
Message-ID: <45op8n$nrk@news.cei.net>
Source record: 87973

Does anyone have a copy of the docs to install a Rambo XL upgrade in an 800XL?

I had this unit in an old 800XL that came to an early demise, and I would like to put it into my working, stock 800XL.

Also, wasn't there a 512K (Bucholtz?) mod to the RamboXL that stacked another set of 256K chips on top of the Rambo 256K's?

Source record: 87975

James King (jeking@xmission.com) wrote:
: I still havent had any luck with APE, by the way. It works very
: sporadically and doesnt like WIN95 at all. Tried it under NT
: Workstation 3.51, and it too puked!
: Any suggestions?

Try running it under dos 6.x, without WIN95 running. Even though
you might be booting into dos-mode with WIN95, it slows down the system
to the point that programs which rely upon timings, fail miserably. This
is also the same under WinNT.
On a related note, its odd to see applications run on the same machine
but under different os's. You really notice the slowdown on the machine
due to running Win95 / WinNT. Neither of those will run on a 386DX, although
Linux really squeezes every last ounce out of the same machine.

3255. sio copy - help please

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-15 00:00:00 UTC
From: a.bartz@ix.netcom.com
Message-ID: <45rdfd$7dc@ixnews4.ix.netcom.com>
Source record: 87977

Can anyone help me with the siocopy program / cable. I have assembled the cable correctly, but can not get the atari drive to respond. I am running an AMD 486/100 cpu under win/95. Has anyone else tryed this program, or is there a newer revision. This one is dated august 1994.

I have a lot of atari programs from the pre 90's and would like to copy the disks over to image files to run on the atari emulator. The siocopy cable seemed the easier cable to make.

Thank you.

Alan

3256. Re: ATARI EQUIPMENT MUST SELL!! IT SAYS Make Offer, REASONABLE

Source record: 87978

$.02; I hang out in the for sale sigs a lot & there is somewhat of a tradition on what your initial asking price should be. It is completely irrelevent what "price new" was. There are only two accepted pricing practices, approximately 1/2 the price it is available for out the door or 70% of the price with the caveat "best offer". Since superior computers to the 400 such as the 800XL/130XE sold new for around $100, a 400 with a lousy keyboard, less features, less memory, should go for less then $25. I believe at least one of the long time Atari Stores like B&C will sell you a 400 for $29.
Terry, let us assume nobody here assumes you are stupid or are not knowlegeable about the current market prices. The only thing left is you are trying to gouge someone. If you were successful in this endevor, how do you think it would reflect on the group as a whole? None of us would like word being spread around the net, "Hey! I got ripped off in the Atari 8 sig!" I came out saying your price on the ATR was not out of line, but the rest of the stuff is way to high. In a community type forum people do have a right to comment on issues that may adversely affect their collective reputation.
Sorry for the verbose post folks.

3257. Sega Genesis joysticks for Atari8

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-15 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <plLEIoA.ransom22@delphi.com>
Source record: 87979

I'd read several messages over the last few years that stated the
Genesis controllers work with the Atari8.
My SO, Carole, has never been fond of Atari games -whether 8-bit,
VCS, or 7800. Yet, she plays SNES and MS-DOS games all the time. I
thought at first that it was the resolution or sound or something that
was making her think they weren't worth playing.
Turns out, it was the joystick. The standard Atari Joysticks (and
their permutations by Wico and others) are uncomfortable for her to hold.
She uses the "Advantage"-type joystick when playing on the game systems.
So, I purchased the standard Sega Genesis 6-button Joystick
yesterday, hooked up the XEGM to the 29" TV, and asked if she wanted to
try it again.
She was very excited about the new stick, and said it felt comfortable
in her hand. I set her up with the Lode Runner cart. She's been playing it
since yesterday, and has already far surpassed the highest level I have
ever gotten to. :)
We have a collection of more than 50 boxed carts, so she now ha
er, has plenty of games to play. :) Plus, if we hook up a disk drive, she
can play the hundreds of disk-based games I own - and I'm buying more all
the time. (At prices 1/5 or less of the price of a current SNES or Jag
game. :)
Anyway, thanks to those who had mentioned that the Genesis sticks
work with the 8-bit. It's made our gaming lives a lot more fun. :)

3259. Possible Multi-BILLION $ Market

Newsgroup: comp.sys.atari.8bit

More About the Device Operating
System: 15 October 1995

There are probably about as many
non-IBM systems out there as there are
copies of WIN95. What a waste of
technology if we couldn't re-utilize
or recycle this technology, right?

The DOS I have designed is aimed
primairly at the following three
market areas:
1. Those who CHOOSE NOT to
upgrade
2. Those who could NOT AFFORD to
upgrade
3. Those who did but still have
some classic lying around somewhere

Let's face it, not everyone can afford
the luxury to upgrade to a so-called
"powerful" pentium machine. Those who
could, did so reluctantly. Out of
necessity for school or work. Those
of us who choose not to upgrade, did
not simply for the fact that we didn't
want to. Even if we could! Our
classics have lasted this long because
we refuse to let them die! My DOS
will bring new life back into our
orphans.

Sure, there are emulators that allow
an IBM or compatable to run a
"majority" of the software from our
classics, but they all lack something.
The ability to utilize or take
advantage of the power and speed of
the machine without compromising
compatability. Why should we upgrade
to an IBM when we spent so much time
and money on the systems we already
have? Even when new programs are
still being written for our classic
machines?

My DOS would NOT need to compromise compatability while bringing the Operating Systems up-to-date with current and future standards. With that in mind...

There is a possible Multi-BILLION dollar market for this DOS, simply for the fact of the way I have designed it. This universal DOS allows cross-platform communication while retaining the distinct flavor of our individual classic systems.

It's being designed on a bi-level format. The Primary Level is a whole new system while the Secondary Level is a new DOS for the individual classics. This allows direct access

between the main system & the different sub-systems, such as your Apple's, Atari's, Commodore's, TI's, and CoCo's. The primary system would be capable of reading disk formats from all of the support systems, while the secondary sub-systems may not.

The orphans could be used as slaves for this new DOS OR vice versa. Some minimal networking capabilities will be provided to allow for this.

Not only would this allow people to keep their entire classic software library, but fresh, new programs would be developed. Programs that could run under either a CLI or GUI type enviorment. This would eliminate the need for a WINDOWS type user interface always being present.

This DOS IS universal. Which means it can be adapted for ANY enviorment under ANY situation. For example, it could be used to develop a Phillips CD-I or Sony Playstation type machine-without the need for a keyboard or other external hardware. It could also be used for Interactive-Television or Virtual-Reality or even coin-operated video arcade games. This also would

eliminate the WINDOWS "standard".

An example machine would be a video/arcade CD player capable of playing upto 5 CD's in a single unit (cartridge or turntable). Photo CD, Video Laser-Disc, and Audio CD compatable. Two or more units can be daisy chained together. Audio CD's can be played while viewing Photo-CD's or playing games. It could also include a modem for online games. Real-Time.

This would allow companion CD's for reference, such as Compton's Interactive Encyclopedia to be expanded as necessary. For example, with U.S. or World History discs, a scientific yearbook, geographical index (maps), updates, educational games, etc. Games could be expanded with more levels, more uniqueness or randomness in play, more playability. All with little or no disc swapping. One older game in particular comes to mind, "ALTERNATE REALITY". This basically added levels to the same game WITH disk change. This could also work with a coin-op video game LAN. (I think you get the idea)

This also sets up the interactive CD

player to be used as an external device for the main or primary system. Allowing the main system access to multiple CD's.

The DOS for the sub-systems would include:
1. Boot up CP or Menu
2. System setup or auto-config
3. Data interchange program (DIF)
4. A proprietary BASIC programming language with compiler (the compiler also works with system BASIC)
5. A modem game maker with font editor, sound editor, screen editor or map maker, and mini-term program

6. A text or line editor
7. A mini-assembler

When possible, the DOS for the sub-systems will be included in ROM or Cartridge format: C64, C128, VIC20, Atari8, TI, CoCo, etc.

The classic systems will no longer be limited to 16Meg hard drives or 64K RAM (without banking).

3260. Atari Classics & Current Notes

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-16 00:00:00 UTC
From: bosco@yab.com
Message-ID: <45t35j$8g9@news.yab.com>
Source record: 87982

Me and a few friends of mine were wondering about the status of Atari Classics & Current Notes. Both mags have seemed to have dropped from the face of the Earth. Has there been 2 or 3 issues of the "New" Atari Classics? I understand that Current Notes has been purchased by two "TAF" members, but getting any info from them is like squeezing blood from a rock.

There are some paid subscribers out in Atari-land that are getting very nervous about their status. We don't want another Antic Rip-Off!

BTW - If there was a third issue of Atari Classics, could someone send me Bob Wooley's e-mail address? No one in the Phoenix area got their copy.

3261. WTB: Joysticks and Infocom Games

Source record: 87983

I figure my Atari stuff has been idling for far too long and it's time for me to start tinkering again. So I'm looking for some stuff...

I have a soft spot in my heart for all things Infocom (except the new Return to Zork for PeeCee's ;-) and would like to round out my collection of games. If anyone either (a) has complete copies of these for sale, including all the little trinkets or (b) is aware of a commercial site who might have one or more of these for sale, I'd appreciate some feedback. Here's a list of the games I'm looking for...

Zork 2
Zork 3
Sorcerer
Spellbreaker
Witness
Suspect
Leather Goddesses of Phobos (I think this came out for the 8-bit)
Trinity (PC version)

Also, years ago Atari marketed Remote Controlled Joysticks. I have a little project which would make use of a pair of these thingies - anyone have a pair they'd be willing to part with at non-Terry Ortman prices?

- Mike Jewison

Ya, but all the games they have in their liquidation list are games I already own. :-(Although I did pick up a copy of Fooblitzky for $3.00.

|> Contact Ralph via email -- he's been posting like mad!

In theory a good idea - they might have the odd copy of a game lying around and not bother to advertise it. On the other hand, I've sent Ralph two email messages over the past six weeks and there's been nary a response.

>
>Anybody else out there agree? Disagree?

This is what I suggested a couple of months ago, but there was a
definate lack of writers. Here are a couple of the Ideas I had:

- Distribute it in HTML format, that way any person who has some sort of
Web Browser could view it, regardless of OS.

- Prepare a straight ASCII version for those without a browser, and make
available as a separate file the pictures in a generic format.

I've even written a sample issue (basically a cover page and a table of
contents.) If someone would like to see it I could probably put it on
my home page. (But this means I'll have to actually put one up!!!)

Maybe it would be time to start it again. (If anyone does remember, I
used to do the Zmag distributions for the Internet, until it fizzled
out. I do still have the list though!!)

3264. "MUX-Window" coming to life! :)

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-16 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <45uk4r$krc@nic-nac.CSU.net>
Source record: 87986

I got frustrated today, so I sat down in Action! (it's been a while,
admittedly) and started hacking away. It's as slow as molassus <sp?>
but that's only due to the blinding <sic> speed of the OS draw routines.
They shall be replaced, of course. >:^)

Anyway, what I'm doing goes very much along the lines of the real honest to
goodness X-Window system for Unix et. al. Unfortunately for me, Action!
only allows for 8 <yikes> parameters to be sent to a procedure/function,
so I'll have to make up some structs.. hmm... guess I WILL end up making
"Graphics Contexts". :)

Let me show you what a typical (in Action!) MUX-Window program would look
like. Once a real MUX version comes out (the current one is stand alone
on one machine) it will be just as easily programmed for in C, Pascal,
and to lesser extents BASIC, Quick, etc. It's all device ("M:") driven. :)

```
; Simple Example program for MUX-Window

Include "D:MUXW.ACT" ; get our routines (in BASIC, for example, they'd
; be something you ENTER first, then add to, and then
; call with GOSUB's)

Proc Main()
Window win

Connect("Example","Demo") ; who am I and what am I

win = OpenWin (10,10,100,120,3,"Example") ; (10,10),100x120,border=3

DrawLine(win,10,10,20,20,BLACK,NORMAL) ; normal, black line
DrawLine(win,20,20,30,30,BLACK,DASHED) ; dashed, black line
DrawRect(win,30,30,10,10,BLACK,NORMAL,BLACK) ; black-outline, black-fill
DrawRect(win,35,35,10,10,BLACK,NORMAL,WHITE) ; black-outline, white-fill
DrawRect(win,40,40,10,10,BLACK,NORMAL,CLEAR) ; black-outline, not-filled

; do something to wait for a keypress....
; ????

CloseWin(win)
DisConnect()
Return
```

The color/modes for lines and fills will be turned into a structure (again,
mainly because Action! can't support more than 8 parameters <sigh>), so
you'll actually get:

```
Line color
Line background (for dashes)
```

Line mode (normal, dashed, etc.)
Line thickness
Dashed-size
Undashed-size
Fill color
Fill background (for patterns)
Fill mode (normal, dashed, etc.)

And remember, the cool thing is, you can have "Clear" for a color. :)

Anyway, just thought I'd let everyone know what's up. The "MUX-Window"
page (accessible from my home page (http://zippy.sonoma.edu/~kendrick/)
and my AODS home page (http://zippy.sonoma.edu/~kendrick/nbs/ados/))
has been updated and has a real example program up! :)

It even works! (with the current MUX*.ACT support files ;))

I just started messing around with APE 1.06 and I found that it would lock up the system when I used a large disk image ONLY if I had SMARTDRV enabled. I use DOS 6.20. If I disable SMARTDRV before starting APE and then enable it when I leave APE, I don't seem to have any trouble.

I should have sent this info to Steven Tucker before posting, but here it is anyway. APE is a great product....maybe I can get my wife to register it for me for my birthday.

That's not quite the answer I was looking for. What I meant was, how fair is the price being offered to me? I have nothing against paying a first-offer price so long as it's a fair deal.

I'd like to see that /in addition to/ the print mags (assuming they
get going again).
If there's a demand for it, I'd be willing to write a few articles
for the electronic mag. I can do the type of stuff I've had published
before (basically opinion pieces), articles on assembly language progamming
(since I am just now learning it myself, I may have a good perspective
for those who also want to learn), possibly other stuff.
The more content carried by whatever means available, the better,
is the way I see it. :)

Current notes is owned by Howard Carson of the Toronto Atari Federation. I have a press release somewhere around here that I will be including in the Christmas edition of the Hamilton Burlington Oakville Atari Users' Group Gazette.

As far as I know, both Current notes and Atari Classics will have their next issue out very soon.

3270. MUX Window Source-code available

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-17 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <45v8g3$40f@nic-nac.CSU.net>
Source record: 87992

I've put two source codes and the current reference document for MUX-Window, the upcoming windowing system for Atari's (esp. those connected via a MUX local area network) on my home page at:

http://zippy.sonoma.edu/~kendrick/nbs/ados/

There are (at this writing) two Action! source files (in ASCII text), one example (text only; all other examples will be GIF captures), and the reference (40 column ASCII text).

The current version, MUXLessW v.0.0, is an Action!-only set of routines which, instead of sending the requests from your program over the network, simply DO the work themselves.

This means that memory will be disappearing shortly, :), but for the small examples which I'll be presenting with the first official releases (and that are up on my home page) I think (HOPE) I'll have enough.

The current stand-alone version is in the works, of course, including the reference manual, so, although the version number (0.0) of the reference will remain the same for quite a while, it'll still be updated at least weekly (probably much more often than that, knowing me and new project ;)).

If anyone (who's good with Action! and/or assembler, preferably -both-) would like to help out, please e-mail me (kendrick@zippy.sonoma.edu). I need some especially fast drawing routines to be written. <;^) (It's horrifying, after using Macs and Suns all day, to see a window take 1.5 seconds to draw!!)

Thanks in advance! Hope to see you on my home page! ;)

3272. sio2pc-can't format

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-17 00:00:00 UTC
From: Norbert Schulz <100273.305@CompuServe.COM>
Message-ID: <45vkfifct1@mhadf.production.compuserve.com>
Source record: 87994

I have a problem using sio2pc. I recently got Xformer from Branch
Always in order to transfer all my old Atari 8bit stuff to my PC.
I build the sio2pc-interface to copy my atari disks to PC
diskimages. The interface seems to work fine (I was able to boot
my Atari 800xl from the atari.atr disk image and I could read and
write to files on this image). But I failed to format any new
disk image. My first problem was to decide which image size and
density I should use.I tried various formats. When I try to
format one of these disk (with DOS 2.5) I always got various
error messages (mostly 138 - timeout).

How must I configure a sio2pc diskimage so that I can copy a
1050 enhanced density disk to it or even format it to the
1050 enhanced density ?
It would be great if someone could send my a sio2pc startup
batch file for this.

Thanks in advance for any help,

Norbert, norbert@cadul.de

>Does anyone out there know Visual Basic -- and care to port SIO2PC or
>APE over??

Are you saying that simply porting the source code to Visual BASIC will make it run better than the existing DOS app does in an emulator (?) window? Are you SURE of this?

I ask because, while I DON'T have Visual BASIC, I DO have access to Visual C++ under Windows NT, and would be interested in the possibility of porting to THAT environment for my own use. However, there wouldn't be much point in doing so, if the resulting program isn't at least SOMEWHAT likely to actually WORK. Thoughts? Anybody care to make an estimate of the likelihood of getting acceptable SIO2PC support in a native W/NT application? Deeply subtle programming techniques are no obstacle; CAN IT BE DONE? :-)

On a related note, the only PC I currently have is a clunky old PC XT. I have no idea whether it'll support SIO2PC; anybody know? When-and-if I buy a more modern PC, I will most likely run Windows NT on it, which would re-emphasize the previous paragraph...

While we're at it, does anybody have a used Black Box in operating condition that they'd be interested in selling? I'd only want to pay about $100, as the original $200 price tag is the entire reason I haven't bought a BB before in all these years I've had my Atari(s). Doesn't make sense to put a $200 peripheral on a $30 computer... But now that I've got a spare HD or two already in my hand, and am starting to worry about availability of floppy drives, disks (where the HELL does one buy 5.25" SD floppies anymore???) (for that matter, where does one buy 3.5" SD floppies (without the second hole indicating "high density")?), I can ALMOST justify the $100 price range. So I'm waiting for the "going rate" for used, working BBs to drop to that range, then I'm looking to pick one up. Anybody interested? Think you WILL BE interested in 6 months, a year, SOMEtime? Let me know.

: SIO2PC or APE -- I'd really like to run it in a window in the
: background.

I know what you mean, but to be honest, Windows is not the answer.
I'de imagine that people have had better success with sio2pc/ape running
under OS2warp than anything MicroSoft based. What I'de love to see is
a sio2pc/ape thing for Linux! If only I had a PC of my own, I'de be willing to
produce such a beast. Would be simple enough to do as a program that
has real time priority or even a loadable kernel module.

: Does anyone out there know Visual Basic -- and care to port SIO2PC or
: APE over??

I know visual basic, and that is NOT the answer either. Visual
C++ would be a better choice. I beleive that Steve wrote APE in Pascal
so it might be easier to do in Delphi'95 (Visual Pascal).

No.. I doubt you can just PORT over the current code from SIO2PC or
APE directly into Visual Basic.

What I was getting at is -- I know that SIO2PC or APE COULD work in a
windows environment -- or DESQVIEW at the least. I just wish somebody
would try it.

3277. Newbie Serial I/O Question

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-17 00:00:00 UTC
From: Brad Rogers <brad@pianosa.demon.co.uk>
Message-ID: <3084894d@pianosa.demon.co.uk>
Source record: 87999

Whilst reading the usual rubbish I find here, DarkStar wrote something
interesting to All about Newbie Serial I/O Question:

Hi DarkStar,

D> Haven't seen a FAQ regarding serial I/O on this machine.
D> Other than the odd-ball (DIN-5) connector, is the serial port RS-232C?

The 5 pin DIN conn isn't a serial port, it's the video output. The serial port
is the large conn. at the right hand side of the 130XE's rear face.
Even then, it's not RS-232, but TTL level stuff. Suitable for connecting
8-bit peripherals, *only*. To use RS-232 you need something else. See below.

D> Will the on-board BASIC do simple serial I/O for a terminal?

Yes, but you need some sort of RS-232 port. Either an Atari 850 i/f module, or
a P:R:Connection will suffice. Also, you need the relevant driver software for
the port, which should be supplied with it.

Chris; My son spent *weeks* trying to get an SIO2PC cable to run under [Windows 3.1, OS/2] & the results were IMO: Completely unsatisfactory. You still get so many NACKs, if you do anything like programming where you save copies of your program every 5 miniutes or so you won't use it after the first 2 or 3 failed saves. I did get it to run on my old AT&T 6300 in the background under Deskview, but I hate that old 8 MHz clunker. The program works great with no matter how bad of a clone you have. I'm currently putting together a $8 clone board with built in serial/printer/floppy with a $5 20meg hard card. I figure I'll be able to fit everything into a box the size of a large dictionary.
I just came into full docs for the IBM, their equivalent to Mapping & Hardware Technical Ref rolled into one. It turns out they have their interrupts prioritized. SIO2PC & APE both use R.I. to monitor the Atari Command line, this is one of the lowest priority interrupts you can have on the IBM serial ports. We'll see, but I'll try to get a cable in the hands of Steve so he can have a shot at seeing if changing the Atari Command line to something a little quicker will help, but I take full responsibilty for nothing being done in the last month or two. I'll get off my butt this week since I seem to be the bottle neck<g>. It may not work out anyway, but it's worth a shot.
Rick

RE: Serial on the 130XE, the DIN connectors are only for the +5V power supply & hooking up a composite monitor. The serial buss is the large Molex<?> connector on the back. You can't use it for RS232 without some hardware. You can use the built in Basic for serial communication i.e. modems, null modem, printers, but only if you have the hardware for it.

>
The DIN-5 connector is for audio and video. The 13-pin connector is
serial, but it isn't RS-232C. Watch this newsgroup for posts about
"SIO2PC". It's a simple device which can be used as an RS-232 interface.

>Will the on-board BASIC do simple serial I/O for a terminal?
>
Simple terminal programs can be written in BASIC, but you need a handler
file for the particular interface or modem, and Basic programs usually
can't keep up with speeds over 300 baud.

-Suncom Tac-2 Joystick $3.00 min

-TurboGrafx 16 Multicontroller adapter $5.00 min

Send all bids to: james.manazer@m.cc.utah.edu

TRADES:

I am looking for R/ER/UR carts and a few UUs for
the Atari 2600 and Colecovision only!

HERE ARE THE RULES:

1. This auction will end on WEDNESDAY, NOVEMBER 1, 1995
at Midnight Mountain Time unless there is still heavy bidding. If
so, the bidding will continue until the following Sunday at Midnight.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject should be SWAPMEET BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $8.00 and $15.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee, no warranty and no refunds
on anything purchased from this auction. Most of the
cartridges have been tested and do work the same goes
for many of the systems. However, cartridges for systems
which I do not own cannot be tested and neither can
systems which have no cables. If you are curious about the
condition of a label...ask.

10. I reserve the right to refuse bids.

11. I reserve the right to alter the rules or the auction itself.

12. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated

Send all bids to: jrm8248@u.cc.utah.edu

: monitor side, though. Thanks in advance for your help.......Howard

Yep, just about all of the older Commodore monitors will work with our Atari 8-bits. What kind are you getting? The Commodore 1701/1702 series composite monitor is great, and comes with regular composite and audio and also split video. All you need is a 5-pin DIN to RCA plugs cable from your 800/800XL or 130XE or equivalent and you are set. There are also other Commodore monitors which are compatible.

If you were asking me, the very best monitor I have seen to date for use with the Atari 8-bit is the Commodore 1084D monitor. It has a superb picture! But the 1701 or 1702 are pretty good, too.

> They shall be replaced, of course. >:^)

Bill, I've been following your posts on this, and while it is
interesting, why are you trying to do windows?

Wouldn't it be easier to set up three types of display a program could
use:

1. All text
Good for utilities, newsreading, menus, and stuff that needs to
put lots of stuff on screen quickly. (Granted, it would really help if
there was a built in 80 col. mode, but oh well.)

2. Mix graphics and text
Use the capablities that the Atari is good for! This would be
custom dli's, for example, on the top half of the screen a graph of the
equation you typed in the text mode at the bottom of the screen.

3. All graphics
Drawing programs, etc.

I've seen GEOS on the 64, and while it barely has windows, the windows
it has are very slow. Windows only get in the way, unless you are
running 1024X768 on a 20" monitor!!!!

>help, but I take full responsibilty for nothing being done in the
>last month or two.

Yes, the modem status interrupt (triggered by the Ring Indicator line)
is the lowest priority interrupt the UART produces, but that isn't the
whole story.
(1) The other and higher priority interrupts are for things like
framing errors, a dead line, the receive buffer being full or the
transmit buffer empty. Also, priority only comes into play when
UART interrupt causing events happen "simultaneously". Once you get an
interrupt, you can examine UART registers to determine anything you want
to know, such as receive buffer full *and* ring indicator.
(2) There isn't any other line that can be used to produce an
interrupt. Without interrupts you're reduced to polling, which brings
it's own much bigger warts into the picture.
(3) The priority is lowest with respect to the UART. There is
another priority scheme inflicted (er, supported) by the PICs
(Programmable Interrupt Controllers). That's where the IRQs come in. The
serial ports usually have a low IRQ number, which gives a relatively
high priorty in the big picture of all the interrupt producers in the
machine.
(4) The time spent servicing an interrupt needs to be small, or
the next one will come along before you're finished the first. The Atari
Operating System User's Manual notes that COMMAND changes 750-1600
microseconds before the command frame is sent.

I have a commodore monitor that I have used for years with an 800, 800xl, 400,
nintendo , and a sega. you have to get a cable and hook it into the back via the 3 inputs.
I dont remember how I did it though. but im sure some one could get the old directions.
btw....the thing worked great.

Date: Thu, 19 Oct 1995 23:52:35 +0300 (EET)
Subject: peep from the lost souls.. or something

Hmm.. my main account appears to have closed, and anyone who mailed
to it (rick cortese?) got no response!

Well, I'm here, I can't read c.s.a.8 but this is my current address
until I find a goot net provider.

(oops, good above)

If anyone is wondering about Ice-T, well, I can't work on it without
128K (needed for the only assembler suited for the job, MAE), and my
XE is still quite dead. If anyone is willing to fix it for me (I pay
shipping, parts etc.), I'll be glad if they mail me at the below
address.

For now, I have a flea-market-new PAL 800xl.. The demos are cooler than
ever before, but I can't do much with 64K other than work on Col80 (my
80-column file reader.. trying to add upwards movement.. monstrous!!).

I work for the Shadow of Shadow SoftWare. One of Shadow SoftWare's Products is BBS SoftWare called Carina. The Shadow needs to setup some new SysOps with MIOs for their BBS. These new SysOps will be paying for their own MIOs and as those of us who are SysOps know being a SysOp is a thankless job and the Pay is non existent. He's looking for MIOs at a good price and I don't think he'll be interested in buying from FTE until He works out problems meeting demand. The Shadows BBS, called ACE of America has 3 Phone Lines at (503)761-9074.

He's also looking for complete hard drives for the Atari 8 Bit.

To reply, call ACE BBS at (503)761-9074
or reply in E-Mail to bensmith@teleport.com

Please limit all replies to E-Mail.

I've built it and used it. I hooked up an old Percom drive and it worked most of the time. I say "most" baecause the drive itself is half-busted anyway. But yes, it works fine with XFormer.

By the way, the cable is very different from the $25 or more SIO cables. It was very easy to make... just clip an Atari I/O cable in half and connect about six or seven wires to pins in a 25-pin male connector. That's it! Cost was about three dollars at Radio Shack for the parallel port connection.

Bill

>Any ideas?

Yes! :) There is a bug in 1.06 that prevents writes to images using Mydos. It
was not fixed because until a couple weeks ago NOBODY at all complained
about it.

Look for this to be fixed in 1.07. You can still write using spartados w/
ultraspeed, but i made an error in the unregistered compiler switches
that caused it.

Steve

PS: This problem does not exist in the registered version ;)

>re-emphasize the previous paragraph...

The problem is not with APE or SIO2PC. Ive explained this many MANY times both
in the APE documentation and in this newsgroup. Windows (or NT, or 95, or OS/2
for that matter) CAN RUN APE AND SIO2PC.

The problem is that Windows, NT, 95, OS/2, etc ALL SLICE TIME AWAY FROM THE
APPLICATIONS THEY ARE RUNNING. Even in 'exclusive' mode, these progams
still steal OS time for thier own housekeeping functions.

When the atari expects a response, and Windows decides to take the CPU away to
refresh your icon cache or something, nothing can be done about it.

You dont run time extremely time critical applications in time sharing operating
systems.

Steve

(Sorry for sounding brash, but im kind of getting tired of people moaning about how APE 'wont run under Win95', when the information they need is in the documentation)

I also have the AMD 486/100. Turn off the "turbo" switch. This will
dummy the computer down to 33mhz, which worked fine for me. Why does
this work? Who knows, but the programmer mentions in the docs that he
wrote the program on a 486DX33.

Ryan 'Gozar' Collins <RLCOLLI@IBM.NET> wrote:
>
>Bill, I've been following your posts on this, and while it is
>interesting, why are you trying to do windows?

Thanx. :) I'm trying to do it because it's a nice interface, the X-Window (client/server, hints, etc.) ideas are VERY cool (hints = suggestions; ie, the program can ask "I want my window at 0,0" but the window is actually placed elsewhere for some other reason (no overlapping, for example).

And since it's client/server (and this can be done with ONE machine, as D. Davies pointed out back in the days of ADOS-discussions - instead of JSR'ing to some routine, it's all vector-based and completely modular), you can replace, say, my crappy window manager (B/W only, windows must be on single byte boundaries (else they get snapped to them) and are fitted with byte-divisible widths (ie, you say "7", it comes out 8. You say "9" it comes out 16, you say "15" it comes out 16, etc.) with a GOOD window manager (CV15 64 colors, virtual screens (move within a larger area - say, 4 times the screen's actual size (2 screens across by 2 down)), OR with a TINY window manager (text only, no windows- each "window" is a full screen ;)), etc...

(It's the above types of concepts which I'd like to put down to paper/HTML ;) a little better because these are important and very likeable concepts.)

>Wouldn't it be easier to set up three types of display a program could
>use:
>
>1. All text
> Good for utilities, newsreading, menus, and stuff that needs to
>put lots of stuff on screen quickly. (Granted, it would really help if
>there was a built in 80 col. mode, but oh well.)

Again, I had thought of this before. A snippet of Action! code within some graphics-intensive program could be:

```
Proc Main()
...
Connect()
If GetDepth() = 0 Then ; 1bit = mono, 2bit = 4 color, 0bit = text
ErrorMessage() ; complain and exit
Fi
...
```

Or, to test for a certain version of a "Window Manager" (aka program running
on the "server" - or even as part of your program (again, single-computer))

```
...
GetModel(model,ver,date,manuf)
If SCompare(model,"GoofyWM") = 0 Then
If Val(ver) < 3 Then
ErrorMessage() ; complain you need ver. 3 or better
Fi
Fi
```

>2. Mix graphics and text
> Use the capablities that the Atari is good for! This would be
>custom dli's, for example, on the top half of the screen a graph of the
>equation you typed in the text mode at the bottom of the screen.

I've thought - it's difficult, unless you're talking about an Atari 7800's
..umm.. MARIA? chip, to nicely incorporate Atari "tricks" (ie, hardware
graphics doodads). Ah, except for such niceties as 64 color medium res
or 8 color high res modes... Again, it's all pretty transparent to the
programs, as long as if they take advantage of anything except the lowest
denominator that they TEST to see if what they want is supported by whatever
particular "Window Manager" the end user happens to be running.. NEVER
ASSUME >ANYTHING<! :)

>3. All graphics
> Drawing programs, etc.

The same as the text-only idea.. you simply see if it's supported.
If you're messing with some RGB-only graphics program, you'll want to be
sure your depth is 3 or 6 - or even higher (who said the Window manager
even has to be running on an Atari? why not use a PC for the graphics
and the Ataris for the CPUs? Or vice-versa.. but I'm getting WAY beyond
what I'm even planning on doing at the moment - but it WON'T be hard...
Simply replace the "M:" (MUX device) driver with some smart "R:" driver
which talks to a null modem and . . . .

>I've seen GEOS on the 64, and while it barely has windows, the windows
>it has are very slow. Windows only get in the way, unless you are
>running 1024X768 on a 20" monitor!!!!

Hehe - even that res. ain't enough some times... (and those monitors give
headaches, man.. uggh!)

Ok.. a few things about GEOS:

(1) C=64 graphics - very strange.. kinda like Apple II's, I believe..
(2) C=64 CPU rate - 1 MHz or so?
(3) C=64 # CPUs - 1 CPU for app(s?) and GUI stuff... in my example,
1 CPU PER app and 1 CPU DEDICATED to GUI stuff
(and other management like launching apps, etc.,
so that you need not touch the other computers)

Anyway - seem at least a little better? :)

Thanx a lot for the comments.. I appreciate it!

I work for the Shadow of Shadow SoftWare. One of Shadow SoftWare's Products is BBS SoftWare called Carina. The Shadow needs to setup some new SysOps with MIOs for their BBS. These new SysOps will be paying for their own MIOs and as those of us who are SysOps know being a SysOp is a thankless job and the Pay is non existent. He's looking for MIOs at a good price and I don't think he'll be interested in buying from FTE until He works out problems meeting demand. The Shadows BBS, called ACE of America has 3 Phone Lines at (503)761-9074.

He's also looking for complete hard drives for the Atari 8 Bit.

To reply, call ACE BBS at (503)761-9074
or reply in E-Mail to bensmith@teleport.com

Please limit all replies to E-Mail.

>The instructions say to run remote.obj located in the atari.atr file.
>What do I do with the atari file atari.atr to get it into the ram disk
>as it instructs? sorry for the dumb questions.

You only need to use REMOTE if you want to talk to SIO2PC (the program)
without being at the PC's keyboard.

For example, my PC and Atari are right next to each other. I've never even
TRIED remote and I've had a pretty happy time using SIO2PC. :)

To load the ATR file, simply type [L] on the PC and follow the prompts.
(You can also specify which ATRs to load when you load up SIO2PC - so say
you have a dedicated SIO2PC machine AWAY from the Atari (now we need REMOTE).
Simply add a line in your AUTOEXEC.BAT on your PC which Loads SIO2PC and
Tells IT to load some bootable ATR (again, it's simply a command line param.
for SIO2PC). You turn on your PC. You go back to your Atari. Turn it on.
It starts booting up from that ATR disk. Then, IT automatically runs
REMOTE and viola - you're set. (Automation is AUTORUN.SYS (DOS2.5),
REMOTE.AR0 (MyDOS), AUTOEXEC.BAT (SpartaDOS))).

>Thanx again! Got any reason why they closed?

Here's what the cs.utexas.edu gateway sent to me:

==========
There is no longer a mail-to-news gateway on cs.utexas.edu.

It became a magnet for abuse, which we are no longer willing to endure.
For example, last week a newgroup control message for soc.culture.niggers
was issued. It was forged with headers that made it appear to have come
from our gateway. Later this week we were bullied in news.admin.misc,
see <45eg9h$pa2@newsbf02.news.aol.com> for details. And these were just
the two most recent events; there is a long list of others.

No, I am not aware of any other similar gateways. Sorry.
==========

They may not know of other such gateways, but luckily I had two others
listed in my FAQ. I got nervous when the one at decwrl.dec.com also didn't
work anymore, but at least we still have the Yale site.

I'm also thankful again for being subscribed to the Digest, because my
local news server isn't getting any postings again...

Perhaps. But where this analogy breaks down is here: When a old toaster is thrown into the trash, you can always buy another toaster. They are essentially in never-ending supply.

As the years go by, as 8-bit hardware--even the hardware in perfectly good working order--is trashed, the supply decreases. They ain't making no more. Eventually, we'll have no machines to bring new (or returning) Atariphiles into the fold. We'll have few options when we need replacement parts. And eventually, perhaps there will be such a paucity of hardware (and the old classic software?) that it's hard to keep anyone around. One broken part, no replacements, good bye computing platform.

The fact that you can still find systems and (some) software for sale relatively easy doesn't mean it will always be that way. Yes, you can still pick up a complete system for well under $100, fairly easily. But if people decide to junk their systems rather than sell them at $50, where does that leave the future?

: Where the heck do you think all those Commodore 64's went? The #1
: selling computer of all time, still, to this day. They had to go

I see far more Atari8's available than C-64's. I've never had a C-64, and if I had a chance to get one cheap (and room in my puny home to keep it), I'd play with it just a bit...I do see a bunch of Vic-20s, though...and more TI 99/4As than anything else in the world.

3309. MUX window and text

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-20 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199510210228.TAA27896@zippy.sonoma.edu>
Source record: 88031

This is neat.. I've added text drawing support to the MUX-Window test-grounds
program and have a pretty spiffy routine!

Here's a typical call:

```
fnt = LoadFont ("TIMES_9.FON")
DrawString (win, 3, 5, "Hello there!", BLACK, WHITE, fnt)
```

win = Which window to draw into
3,5 = Where to place the upper left-hand corner of the string
"..." = The string to display
BLACK = The color in which to draw the string
WHITE = The color for the background (a rectangle surrounding the string)
fnt = The font to use

Now, for those who have seen some of my other stuff for, say, line drawing,
you'll know I use a special color called "CLEAR"... This comes in very
useful, even for text.

Say you had this in the window: If you position text about center and
used BLACK text and WHITE background:

```
XXXXXXX XXXXXXX
XXXXXXX
XXXXXXX XXX XXX X X XXX
XXXXXXX X XX X X
XXXXXXX X XXX X X X
XXXXXXX
XXXXXXX XXXXXXX
```
A white rectangular area is made
and the text written in black inside

If you used BLACK text and If you used WHITE text and WHITE back-
CLEAR background: ground, you'd get much like the above
except the "TEXT" would be inverse...

```
XXXXXXX If you used CLEAR text and WHITE back-
XXXXXXX ground, you'd get:
XXX XXXXXXXXXX
X XX XXXXXXX XXXXXXX
X XXXXXXXXX
XXXXXXX X X XX
XXXXXXX X X
```
They blend together X X X

```
XXXXXXX
```
Only where there's stuff in the

background does it show through..

There are of course a few more examples, but you get the jest... the reason I came up with this is because in the first example of using text in X Window in the book _X-Window_Application_Programming_, they showed the difference between the C functions "DrawString" and "DrawImageString" - the first being like my MUX-Window "DrawString" command with a "CLEAR" background, and the second like mine with some colored ("WHITE" in the above case) background..

Also, if I didn't post it before, I sped up my window clearing routines.. they're now "limited" to being stuck on byte-wide boundaries (a window being opened at "3,3" would be 'snapped' to "8,8") and byte-divisible widths (again, try to make it 17 x 17 and it becomes 32 x 32).

This is simply for speed, and this is only this implementation - don't be frightened by this... REMEMBER: I'm keeping with X-Window's concept:

"Most everything you tell the window manager is only a SUGGESTION" :)

Of course, no program should particularly care if the window is in the exact (or even NEAR :)) position it wanted it in, or if it's the same size it wanted it to be, or any other specifics about how the Window Manager goes about its business ;)

3310. Making .ATR files?

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-21 00:00:00 UTC
From: jeffk914@groucho.roc.servtech.com
Message-ID: <46bpsd$a0p@murphy.servtech.com>
Source record: 88032

Well, I just got my XFormer 3.2, and it's the first time I've used the Atari emulator... And I've got about a zillion 8bit disks here, having been using the darn 8bits for about 15 years now... :)

But I've got a couple questions, that I don't think I saw in the FAQ... Just HOW does one create an .ATR file? I mean, what happens if I try to initialize a disk in MYDOS? Will it just blow away whatever ATR or .XFD file is listed for that drive?

I managed to find an old 5.25" IBM drive and have been using Util to copy over some files with a decent amount of success (it seems really picky about having a REALLY good disk, much more so than the 1050), and have S2PC to put them into .ATR files, and I have no blank .ATR files to use! Plus, when I tried, just to see if it'd work, to open the MYDOS45D.ATR file, S2PC seemed to think it was a bad image file - 0000 free sectors, etc... Help!

Thanks!

>But if anyone is interested in
>"Bresenham's algorithm" let me know and I will post it.

There is a cool alternative that draws lines faster than Bresenham's.
It's a derivative called "Bresenham's run-length slice line drawing."
I found it in a new book called Zen of Graphics Programming by Micheal
Abrash, and although the book is _very_ IBM PC oriented, it still makes
a very interesting and informative read.

Briefly, the way the routine is optimized, is to eliminate the decision
making process at each pixel the way standard Bresenham's does.
Instead, it capitalizes on the fact that all lines will be made up of
only two different sizes of pixel runs. Let's say a given line will be
made from segments that have either 3 or 4 pixels. Run-length sliced
can draw 3 pixels really quickly, and only then decide whether it needs
to draw a 4th one.

The 5 pin din connector is for a monitor (one for power there too). The serial
i/o is carried on the large molex connector that you attach disk drives to.

Its voltage output is not rs232 standard, but can be made so with a cable
that contains some variant of the MAX232 circuit contained in the SIO2PC
cable. There are also 7400 and other versions that use IC's that are not
quite so hard to find/expensive.

There is a complete listing of both e-mail remailers, and e-mail->usernet
gateways in the alt.2600 FAQ. Last I checked there were quite a few
working e-mail->usenet gateways there.

I, for one, never questioned the "runnability" of APE or SIO2PC in the
timesharing environment. I meant to address only the distinction between
"runnability" and "usability." Obviously APE and SIO2PC *run* in Windows
and Windows NT, but they're not USABLE because of the issues you have so
often mentioned. Believe me, I understand what you're saying -- I'm a
systems-programmer-type, myself.

However, I believe it is an error to attribute the problem SOLELY to the
"timesharing" nature of the operating system. It is perfectly possible to
run "time-critical" (aka "realtime") applications in a timesharing environ-
ment; the product that my employer makes and sells does it, and does it well.
The REAL problem is that the timesharing OS itself has to be well designed,
and has to provide the capability for suitably privileged and prioritized
software to get "first crack" at the necessary resources -- in the case of
APE and SIO2PC, the serial (?) port. What I was TRYING to ask in my first
message was, "does Windows and/or Windows NT provide that class of capa-
bility, to a sufficient degree and in the appropriate areas, necessary for
APE and SIO2PC, or an APE-or-SIO2PC-like Windows or Windows/NT program, to
operate usably?"

It is also necessary for programmers to understand how to implement, and
how to program within, a timesharing environment. It is not clear to me

that this is true either in the case of the Microsoft people who have implemented Windows and Windows/NT, nor in the case of the programmers who have created APE or SIO2PC. It's no great sin if the latter haven't -- this sort of skill is rarely taught and rarely picked up "on the job" except in highly-specialized jobs (such as my own) -- but if the former don't know this stuff inside and out they have NO business foisting off on us a so-called "timesharing" OS. The other half of my original question, then, is now, "did the programmers of APE and SIO2PC write their programs in such a way that a direct port of the source code to Windows/Windows NT will take advantage of the features of the OS so as to operate usably, or will these programs continue to be as unusable as they are when the existing binaries are executed in "DOS emulation" windows?"

I have NO doubt that it WILL prove possible to write a USABLE SIO2PC-type application which functions under Windows NT. I DO have doubts that it will prove possible under Windows or Windows 95. I am asking whether anyone knows FOR SURE, and has credentials to back up their claims.

>(Sorry for sounding brash, but im kind of getting tired of people moaning abou
t
>how APE 'wont run under Win95', when the information they need is in the
>documentation)

Not necessarily. I have Windows NT and very little documentation. What little documentation I HAVE, doesn't tell the kind of thing I need to know.

3317. Re: HELP: Drelbs instructions

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-22 00:00:00 UTC
From: mgfrank@acsu.buffalo.edu
Message-ID: <46e3eu$bto@azure.acsu.buffalo.edu>
Source record: 87857

Scott Butler (sydtech@skypoint.com) asked for help with Drelbs, a fantastic Synapse game. Here are the instructions, with numerous typos corrected. Hope this helps!

[Back of docs]

DRELBS

Requires Atari 400 or 800 with 32K (disk) and 16K (cassette or cartridge) and joysticks.

Once upon a time there was a kingdom that was very small. It was so small in fact that no one larger than a flea ever gave it much thought.

In this tiniest of places there lived a race of peaceful hippety, hoppity creatures called DRELBS.

One day a shadow fell over this happy land. It was invaded by trollaboars, evil looking gnomes of squarish stature who, because they also were not very large, coveted this miniature land for their own. They came with screwhead tanks to destroy the drelbs, and hunted drelbs just for fun.

Although the drelbs were tiny they weren't short on smarts. They led the trollaboars to the atomic flip grid in the center of the city and there decided to make their stand.

Your task, if you've the courage of a friendly drelb, is to defeat the trollaboars on the atomic flip grid. You must be fast and cunning to avoid the hunters and save the drelbs from extinction. And above all, you must have heart! Happy blinking, drelb lover!

SYNAPSE SOFTWARE

[Docs proper]

LOADING DRELBS

Cassette
Pull the release lever above the keyboard towards you to open the cartridge door of the computer. If there are any cartridges in the slots, remove them and close the cartridge door.

Insert the program cassette into the cassette recorder with the label side up. Press the play button on the cassette recorder until it locks in the down position. Hold down the start button on your computer and turn on the power switch. After you hear a beep from your computer, press the return key. The program will load in about four to five minutes.

Should you have any difficulty loading the program, rewind the tape all the way to the beginning and remove from the cassette recorder. Insert a pencil into the sprocket of the cassette and advance the tape into the cassette recorder and try to reload as described above. If this fails, simply flip the cassette over and try loading the reverse side of the tape. The program has been recorded on both sides of the tape.

Disk
Pull the release lever above the keyboard towards you to open the cartridge door. If there are any cartridges in the slots, remove them and close the cartridge door.

Turn on your disk drive and wait for the busy light to go out. Insert the DRELBS program disk into the disk drive label side up with then section [sic] towards the rear of the disk drive. Close the disk drive door and turn on the power of your computer. The program will load in about 30 seconds. If you have any trouble loading the disk, simply turn the disk over and re-boot. The program has been copied onto both sides of the disk.

Cartridge
Pull the release lever above the keyboard towards you to open the cartridge door of the computer. If any other cartridges are present, remove them. Insert the DRELBS cartridge into the left cartridge slot label side towards you and close the cartridge door.

DRELBS

Introduction
In the many ages since the beginning of all things, in the time of sorcerers and unicorns, magic rules all kingdoms. Drelbs happily came and went as they pleased and hardly a cloud passed through their unhurried lives.

Then the trollaboars came. They brought with them evil schemes and sought to enslave all men and Drelbs, and to rule the worlds of love and light.

One by one they caught the hapless Drelbs and trapped them in worlds where the light never came. It is into these dark places that you, as the last of the Drelbs, must venture in order to save your comrades and restore love to its rightful place.

How to Play
You first appear on the atomic flip grid in the center of the Drelbish kingdom. You will notice that as you hop around the grid your movement causes gates to shift position 90 degrees.

Your object is to close off as many of the squares as possible by flipping shut gates of 3/4 completed squares (this may sound far more complicated than it really is). When a 3/4 sealed box is closed by a gate flip it will turn into a pulsing square. In each round you must secure all of the squares possible on the grid.

The Trollaboars also can flip gates, however they cannot complete squares of their own (the Trollaboars are not builders - they are mean and nasty destroyers).

You can also trap the evil Trollaboars inside of the squares that you complete. This immobilizes them only for a short time, whereupon they break free and escape. When you have completed all squares possible on the grid, the squares will begin to fill up with gorgolytes and drelbish windows (see below). Wait patiently and jump through the drelbish window into the dark corridor.

There are eight rounds to complete the game. They are as follows: Sapphire, Ruby, Emerald, Topaz, Peridot, Agate, Amethyst. [sic--that's only seven.]

Drelbish Windows to the Dark Corridor
When this window opens you must hurry as quickly as your drelbish legs can hop you there, and leap through the window into the land of the Gorgolytes, cousins of the Trollaboars, and slavemasters to the Drelbs.

Then quickly, ever so quickly, you can free every Drelb that you touch. But go carefully into that dark place for the Gorgolytes will perceive your presence and hunt you relentlessly until you are tossed back onto the grid.

If, however, you are successful in freeing all of the enslaved Drelbs then you will be transported to the bonus screen, and there your bonus points will be entered towards the goal of freeing all Drelbs from their awful fate.

Hearts
After a certain time hearts will appear along the corridors of the flip grid. You must pursue these for they are magical indeed.

When you run over a heart it will freeze the Trollaboars for five seconds during which you can hop quickly and trap them in a square.

Bonus Screen
You will enter the bonus screen either by kissing the lady that appears in the Gorgolyte boxes or by completing a round of the dark corridor. You will be awarded a bonus equivalent of 250 times the number of completed squares on the atomic flip grid. Then, automatically, you will be transported back to the flip grid to begin the next round.

The Gorgolytes
The Gorgolytes will try to pop into the flip grid. You will see their ugly faces haunting you. Don't let them intimidate you. While they are deadly in the dark corridor they cannot harm you on the grid. However, they will destroy the boxes in which they appear, and be a general nuisance.

The Mystery Lady
Whenever this beautiful face appears in one of the Gorgolyte squares, hop quickly to the square and steal a kiss from this fair damsel for she is sad and confused in a Gorgolyte prison. If you are successful in stealing a kiss, you will jump to the bonus screen. After all the enslaved drelbs are freed, you will discover the secret of the mystery lady!

Diamonds
Occasionally, a magical diamond will appear somewhere on the flip grid. Hurry, hop quickly to the diamond, (for it will quickly disappear) and pass over it. This will open a drelbish window into the dark corridor.

The Screwhead Tanks
The screwhead tanks control the perimeter of the atomic flip grid. They fire dreadful bullets that ricochet off the gates of the grid. Be careful to avoid both the tanks and their bullets, otherwise it's goodbye Drelb.

Trollaboars
These ugly square heads hunt Drelbs just for fun. Stay far away from them if you know what is good for you.

Lives
You have five (5) drelbish lives to complete your mission.

The Options
The [START] button begins the game. To restart, press [R].

The [OPTION] button will put you into option select mode. You can then press the [SELECT] button to choose either NOVICE, TOUGH, or SUPER drelb level of difficulty.

The [SELECT] button allows you to start from a greater difficulty level.

The [SPACE BAR] pauses the game. Moving the joystick restarts play.

There really isn't any more to say, only drelbish valor can save the day.

All Drelbs, everywhere, are counting on you.

WARRANTY

SYNAPSE SOFTWARE warrants to the original consumer/purchaser that this SYNAPSE SOFTWARE program cassette/diskette (not including the computer programs) shall be free from any defects in material or wokmanship for a period of 90 days from the date of purchase. If a defect is discovered

during this 90 day warranty period, and you have timely validated this warranty, SYNAPSE SOFTWARE will repair or replace the cassette at SYNAPSE SOFTWARE's option, provided the cassette and proof of purchase is delivered or mailed, postage prepaid, to SYNAPSE SOFTWARE.

This warranty shall not apply if the cassette (1) has been misused or shows signs of excessive wear, (2) has been damaged by playback equipment, or (3) if the purchaser causes or permits the cassette to be serviced or modified by anyone other than SYNAPSE SOFTWARE. Any applicable implied warranties, including warranties of merchantability and fitness, are hereby limited to 90 days from the date of purchase. Consequential or incidental damages resulting from a breach of any applicable express or implied warranties are hereby excluded.

NOTICE

All SYNAPSE SOFTWARE computer programs are distributed on an "as is" basis without warranty of any kind. The entire risk as to the quality and performance of such programs is with the purchaser. Should the programs prove defective following their purchase, the purchaser and not the manufacturer, distributor, or retailer assumes the entire cost of all necessary servicing or repair.

SYNAPSE SOFTWARE shall have no liability or responsibility to a purchaser, customer, or any other person or entity with respect to any liability, loss, or damage caused or allegged to be caused directly or indirectly by computer programs sold through SYNAPSE SOFTWARE. This includes but is not limited to any interruption of service, loss of business or anticipatory profits or consequential damages resulting from the use or operation of such computer programs.

The provisions of the foregoing warranty are subject to the laws of the state in which the cassette is purchased. Such laws may broaden the warranty protection available to the purchaser of the cassette.

I just picked up one of these modems (relatively cheaply) the other day to use with my 800XL. I have a P:R:Connection and was wondering what a good AT initialization code/settings to store in the modem would be to take advantage of this modem's features.

Thanks!

How many of you actively call Atari 8bit based BBS's??

Just curious if its even worth the effort of reviving the Atari
Connection BBS.

Any comments?

John, I'm not sure, but I ask to take a look at Bill's code for drawing
a window & I'm guessing it can be optimized without to much trouble.
I'm assuming it will just be rectangle so you should be able to figure
the proper bit to set by the byte & bit offset into the screen. For instance
if the window vertical lines are set at 8 & 31, you could just do a
series of storing <OR or ANDing, whatever he's looking for> of 128
at an offset of 1 byte from the left hand side of the screen for the
left boarder & storing a 1 at an offset of 4 bytes for the right border
all with a step of 40 bytes for the vertical height of the window.
At least if it is just vertical & horizontal lines, it shouldn't be
to hard.
Rick

3321. Re: Making .ATR files?

Jeff; are you booting the MyDOS image as drive 1? If it is a broken image, that would pick it up with a boot error. If it is intact, the easiest way to get more images would probably be to just make a copy from MS DOS, i.e. COPY MYDOS.ATR NEWDISK.ATR or whatever you want to call it. Then boot the emulator with:
XF32 MYDOS.ATR NEWDISK.ATR
& you should be able to format the NEWDISK.ATR from the MyDOS menu. If you want to get a large image or custom disk, then it would be a good idea to get SIO2PC or APE to create them. You don't need to actually have a SIO2PC cable to create the disk images, but you will need to use the emulator to format them after they are created. Remember that the Atari DOS 2.5 will not recognize any odd formats or even 256 byte/sector formats.

AMODEM 7.x gets around this problem by using BASIC as an OS environment shell, and loading assembly language modules in RAM that it has stored in ATARI BASIC string arrays. AMODEM 7.x can achieve speeds of 1200 bps and even 2400 bps. The last version of AMODEM I know about was either 7.2 or 7.5. (I wish that the source to the modem assembly string load modules were available. A lot of the methods that AMODEM uses are really quite clever, but a bit hard to follow in BASIC. BASIC is sort of the psuedo-language interpreter for the assembly language string loads.) Trent Dudley's stuff is some of the more complicated BASIC code that I have ever seen (excepting "RAM cram" spaghetti code of the late 1960's).

I am the owner of an Atari 800 (and 400), and I recently stumbled upon the Rainbow emulator for the Macintosh.. The problem is: after unpacking all of my Atari gear (I had it in storage) I can't find my BASIC cartridge...therefore I can't make the ROM image needed for the emulator. Is it legal to have someone else email me the ROM image? If not..is there anyone out there who would do it for me? I would be most appreciative...

Well, I remember DOS 2.5 when it came out, and it was OK (certainly much better than that abortion DOS 3.0), but I've always been a MYDOS man. :) So SIO2PC can make 'em? I'll give it a try, thanks. :)

John! Please post the code snippet! Thanks! Someone (sorry! I've forgotten who!) send me a snippet of Action! code to draw lines which was nice, except when I tried a very simple test, it got mad and started drawing very funky shapes. :) And I'm _pretty_ sure it wasn't a "end point before the start point" problem, because that was one of the first things I tried compensating for..

BTW- it looks like the @newsbase.cs.yale.edu mail-to-new'er is kind of slow, so I'll let people know HERE that for my MUX-Window test-grounds, I've gotten a nifty (albeit limited) text-drawing routine.

You set the foreground (text) color, and the background (rectangle "behind" the text) color. Oh, spiffy, you say. That gives you "normal", "inverse", "all-black" and "all-white". Well, no.. you forgot the other "color" I support on MUX-Window: CLEAR. :) That adds another 5 combinations.. :)

This is almost exactly what I did. I found, with the OS Draw routines,
even short lines still make drawing a rectangle take forever.. so, for
Windows (not anything the user draws), their positions and sizes are
"snapped" within the 40x192 grid that is there in a Graphics 8 screen.

I'd just like someone to send me some Action!-ready (say, coded within a
Proc'edure block ;)) pre-assembled-and-optimized line, point, and
rectangle-drawing routines... Pretty please? ;)

Anyone? Anyone? I mean, of course it's not too important for me, because
the Window-Manager/Server I'm writing right now is all 100% included by
whatever program you're writing, since it's a one-machine setup (I have
yet to purchase a MUX setup), but it WOULD be convenient and would of COURSE
be WONDERFUL to have in any "1st release" of this thing....

I would happily call one every day if it were local. Unfortunately,
the only Atari based BBS that is local to me is ST-based, and it only
grudgingly has anything for 8-bit users.
I don't believe your BBS is local to Chicago, so I doubt I would
ever call. Oh, I did call several times - but every time the lines were
so noisy I couldn't even log on.

-Joe

3335. Atari 800 Emulator for Unix

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-22 00:00:00 UTC
From: David Firth <david@signus.demon.co.uk>
Message-ID: <1995Oct22.191813.324@signus.demon.co.uk>
Source record: 88054
Cross-posted to: comp.sys.atari.8bit,comp.emulators.misc

```
The latest version of this emulator can be downloaded from:-

ftp.demon.co.uk:/pub/emulators/Atari800-0.2.1.tar.gz

IP address of ftp.demon.co.uk is 158.152.1.44

Changes in 0.2.1
----------------

- Created a new Makefile for Unix. The Amiga support is now in
Makefile.amiga
- Sorry, but I renamed the ATARI800 environment variable to ATARI_LIBRARY
which points to /usr/local/lib/atari by default.
- Control + Shift + Key combination for Linux SVGALIB implementation.
- SVGALIB version can be restarted after entering the monitor.
- HELP Key available in XL/XE mode
- Optional XVIEW (V3) Interface for X Window version. Allows disk changes
using a file selector, controller configuration and access to performance
variables.
- BREAK Key fixed
- PC Joysticks can be used with Linux (svgalib, x11 and xview) through the
/dev/js0 and /dev/js1 devices. Second button activates the space bar
which is very useful in Defender :-) Build with "make <system>" where
<system> is one of:- linux-x11-joystick, linux-xview-joystick or
linux-svgalib-joystick
- X11 Joystick emulation using keyboard re-implemented. Straight X11 can
use either numeric keypad or cursor keys + space. XVIEW can only use
cursor keys + space (Problem using keypad in xview!)
- Disk selector for Amiga version + controller configuration menu
- Started code to emulate SERIN and SEROUT registers. At the moment this
is ongoing and does not work. New startup option -nopatch disables the
SIO patch leaving the normal SIO routine in place.

Changes in 0.2.0
----------------

- Separated Playfield Scanlines from Player Missile Scanlines
- Corrected playfield colour errors in Antic modes 8 & 10
- Horizontal Fine Scrolling
- Playfield and Player/Missile Priorities
- Allow Emulator to run either as an Amiga Screen or Window
- Added Paddle support for Amiga

Windows NT is very capable of supporting this kind of "real time" app. This isn't the time or place for this type of info, but there are several good books and technical articles (available on MSDN) that cover this sort of topic in depth. Jeffrey Richter's "Advanced Windows NT" is one good book for this.

I hate when I do that (start typing gibberish for the subject)..

Anyway, a COMPLETE, USEABLE (I hope!) latest version of MUX-Less-W, the non-networked MUX-Window library for Action! is available on my home page at:

http://zippy.sonoma.edu/~kendrick/nbs/ados/

For those who do not yet know, MUX-Window is a protocol I'm developing for the Atari 8-bit which will take advantage of CSS's "Multiplexer" ("MUX") network hardware. (Not saying it HAS to - you should easily be able to replace the MUX drives with RS232 drivers, or joystick-port-based drivers, OR simply write your own Window Manager into, say, extended memory, and rewrite the drivers to simply jump to your Win.Man.!)

MUX-Window is based a lot on the X Window System for Unix and other big OSes.

The plain version of MUX Window will be this setup:

One Atari acting as the MUX Fileserver - just like in any MUX setup

One Atari acting as the Window Manager - any WM can be used, assuming more than one version comes out. 99% of MUX-Window software will not care what WM is being used, unless it has to do with things like graphics support (4 colors vs. 2 colors vs. 64 colors) or something.

Remaining Atari's running applications - these are the MUX-Window programs. A word processor. A spread-sheet. A paint program. All they know is that there's a driver available ("M:", so Bob Puff has told me) which they can talk to - telling it things like "draw a window", and hearing things like "the user pressed the [Return] key" from the device. (Originating, obviously, from the Window Manager software.) Inotherwords, you'll be "multitasking" by simply using multiple computers but one interface - the Atari running the WM.

Anyway, I'm sure a lot of you are sick of hearing this, so, go check out the page if you are.

A few notes: The files are named ".TXT". Most should be ".ACT". They're also all in Unix text format- save them with your browser and run a conversion program on them (like "TT File Translator" for IBMs by DataQue)

I am looking for a master disk of Atari DOS 1.0. We sort of collect
Atari stuff, and we have always heard about version 1.0, but never
actually did see it. We would like to have an original master disk,
with manual if possible. Send me an E-mail if you have this in
the attic and want to get rid of it. Send mail to ernest@pi.net
and is anyone still using 1.0 out there?

3341. !!! New drive cable for PC Xformer !!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-23 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <46gg8t$rcp@news1.halcyon.com>
Source record: 87863

This is more of a market research question for now than enything
else, so if you are reading this please kindly reply to me
using little 'r', not 'f' or 'F', so that I can get a feel for whether
there is enough interest in this.

As you all know, I've been recommending using the SIO2PC cable to
transfer Atari 8-bit disk images from the Atari disks to the PC for use
with PC Xformer. People keep asking "does PC Xformer us the SIO2PC
cable", for which the answer is of course, NO. SIO2PC is NOT a cable
that can connect an Atari 8-bit disk drive to a PC. It only connects an
Atari computer to a PC directly (a null modem cable of sorts). It would
have to be redesigned to permit the direct connection of an Atari 8-bit
disk drive to a PC. This is very much the same as how you have to use
one type of cable to connect an external modem to a PC, and another type
of cable to connect two PCs together (i.e. a laplink cable).

To connect an Atari disk drive directly to a PC (or any computer for
that matter) you need a cable different than SIO2PC. In 1988 I developed
just such a cable for connecting Atari disk drives directly to an Atari
ST. It was called, what else, the Xformer Cable. In addition to making
it very easy to run boot disks and other non-DOS disks, some copy
protected disks can also be run, and you don't have to hassle with
copying files to the PC at all. And of course, no Atari computer is
required.

Enough people keep asking that I am now finally getting off my butt and
putting the necessary support into PC Xformer to allow the use of the
Xformer Cable. So what's the problem you ask? Well, the problem is the
Xformer Cables haven't been manufactured in over 6 years. I made and
sold a few hundred as did various Atari dealers, but as far as I know,
there is no one making the cable any more.

I think it's safe to say that you can't just call up an Atari dealer and
order a Xformer Cable. I'd be willing to do a one time production run of
new Xformer Cables, I don't want to make a thousand of them and find out
I can't sell them. I don't want to make 50 and find out I need more. I'm
not in the business of making cables, so I really just want to do this
once. The quantity will also determine the price of the cables.

If you are a PC Xformer user, or are an Atari 8-bit user that has
considered using PC Xformer on a PC, please answer these questions.

1. Do you currently own a 486 or Pentium based PC?

2. Do you currently run PC Xformer (doesn't matter which version)?

3. Do you own an Atari 8-bit disk drive (810, 1050, XF551, Rana, Indus, etc)?

4. Do you currently use an SIO2PC cable?

5. Do you currently own an old Xformer Cable?

6. If a cable existed to allow you to connect an Atari 8-bit disk drive to your PC and use with PC Xformer, would you buy the cable? Answer either "Yes", "maybe", or "no".

7. Same question as above, except would you be willing to build your own cable if you had the wiring diagram?

8. Do you know other people, who don't have Internet access and thus can't read this, who would be interested in such a cable?

Please reply with your answer as soon as possible so that I can start talking to suppliers about getting parts and start making these.

You could try http://www.usr.com. They have lots of manuals online.

I have a 14.4 Sportster, and other than turning down the volume, there's
not much initialization I needed to do.

3344. UUCP protocol for 8bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-24 00:00:00 UTC
From: jeking@xmission.com
Message-ID: <46hj5q$af4@news.xmission.com>
Source record: 87866

I offer $100-200 for any programmer capable of creating a FULLY
functional UUCP protocol for the 8bit Atari.

The prot. can either work directly via the SpartaDos command line or
preferabbly via BBS Express Pro! or Carina 2.xx

Any takers?

Source record: 87867

I'm REALLY starting to tear my hair out here... From the stuff that comes with XFormer 3.2, it looks pretty slick (not perfect - the sound is off, and it seems to have problems with the bottom of the standard Atari scrolling rainbows), however, I STILL can't get anything but what came with it to work. I've been able to put some of my 8bit stuff onto the PC, and make blank .ATR files, but I can't actually put them into the .ATR files. The "S2PC" program has been totally useless - besides being user-hostile, it just plain doesn't work - or else, I can't get it to recognize ANY .ATR (or .XFD) files as being anything but garbage. I've also tried to convert some .DCMs to .ATRs and boot them, with no luck... They look like the standard demo disks when you get a directory (ie, a customized faked directory), but they just don't run... The ones I've tried are "Veronika", "waf1993a", and "waf1993b" from the archive directory. Are these just plain incompatable, or am I doing something wrong?

Any help would be greatly appreciated. I really want to get this thing working right! :)

Scott Butler (sydtech@skypoint.com) wrote:

: P.S. I had been hoarding food and energy, and sold it all off in round
: 12. Is it better to hang on to this stuff? Will I nab a better score?

Selling it off in round 12 does nothing. You automatically get the value of your goods added to your total. The value of goods is determined by its "round 12 closing price"--either the last traded unit in that round or, if none were traded, the store's buying price (the lower house on the screen).

One time my wife and I were playing and we conspired in turn 12 to leave the computer Mechtrons in the dust. I had 63 units of crystite; she had 37 and the borgs had none. She bought one of my crystite units for over $700. I ended up with $63,000 for the game, she had $48,000 and the total colony score was about 135,000.

If it's just you and three borgs, you can't do that. Usually I hoard the food and energy until I am safely in the lead, then I start to sell it to the other players (charging them $100, $200, $300 or more whenever I can) and then convert everything to crystite. (Usually. Game dynamics can occasionally dictate a different strategy.)

From: grendel@bluefin.net
Message-ID: <grendel.6.0012416D@bluefin.net>
Source record: 87872

Hi, I was recently over to a friends' house and noticed that they had an Atari XE computer hooked up to a television gathering dust in some remote corner of their house... I asked him about it, thinking it might be an ST (sorry - i know next to nothing about Atari computers except for the fact that my family has a 400 and 800 tucked away in a closet at home), but he said it was an XE, and he asked me if i wanted to buy it for a couple bux. I told him i'd get back to him... So now, the questions : What in the smeg is an Atari XE? It looked like it was just a cartridge-based game machine with a keyboard (which would be sorta cool, cause i could play all of my 2600 games in it <GRiN>).. Is it worth anything? Worth purchasing? I own two PeeCee klones and an Amiga 2000 right now, I just like playing around with different platforms, so I kind of wanted to pick up an Atari ST, but... can someone tell me exactly what an XE is and why I should buy it? Is it a computer or a game machine? Does it have an OS? Any help would be appreciated... thanks.

Wow, Someone posted the ftp address og a GNU public liscence Atari800 enulator for unix/linux type of machines. I grabbed the atari800.tar.gz file thinking it was going to be garbage. I was dead wrong, this emulator is great.

Right now in another task under linux I'm playing Doney Kong, and Dig Dug (well I can't really be playing them both, but I switch back and forth to see how bad the game is doing without me there to do anything, while I'm on minicom here. I also compiled online the unix shell account here on tiac, the ascii only versin, which is good for running mac/64, or any of the programming languages or text adventures (if you don't mind a little screen garbage fromtime to time). I can ftp .dcm file from atari.archive.umich.edu, run discomm32 under the emulator on the unix system i call in, convert them to ATR images, then zip them, and zmodem send them, while playing dig dig, or whatever. The emulation is actually cleaner than PC Xformer 3.0, but I don't have my linux sound driver installed, so I don't have sound setup yet, and I think I should recompile my linux kernel to make it more compact, and add in a few drivers I want.

There is an Xwindows version which I hear is good, but the real killer one is the one for the Amiga. It's supposed to be the best Atari 8 bit emulator out, and this atari800.tar file is released under the GNU public liscence (not public domain, but totally free, and distributable, with source code no less). You can compile it on anything that has a C compiler. And the linux-SVGA version I'm running now, is faster than I need on my DX4-100.

Till later. And thank this David Firth. He's great!

Eric

John, I got off my butt & did a code snippet for Bill. Just a Vline
Procedure in Action! Turns out if you just blindly draw a vertical
line w/o doing the house keeping the OS does, i.e. the dreaded
ERROR 141, it is about 5 times faster. I'd guess doing a horizontal
line would be even quicker since you can set 8 pixels at a time after
calculating the change($) at the begining & end. I *think* I've got
an old ANALOG where someone just wrote an Action! equivalent of the
Pascal example in the Technical Ref<?> for line drawing. The author
said it was much faster then the OS routines, but I never did a speed
test with it<sigh>. I don't really use bit mapped graphic modes that
much. I guess if I really had the time, I could rip off BBK Art
routines for circle & rectangle & make them Action! code block/procedures,
but I'm so far behind right now I can't take on another task. Anyway,
the complaint was windows were taking 1.5 seconds to open, if the other
stuff can be optimized too by the same factor, it should get down
to an acceptable time.

From: mbouthil@aol.com
Message-ID: <46n020$hkq@newsbf02.news.aol.com>
Source record: 87878

A month ago, I posted this question in this conference:

>I just noticed that there are no inverse characters on my Atari 800XL.
>This includes the cursor in BASIC (which is now invisible). Turning the
>computer off for a few minutes and then turning it on does not help.

I just wanted to thank everyone for their suggestions and that those of you who suspected a bad Antic chip were correct... replacing it solved my problem!

Anyone else faced with this problem should consider buying a complete set of 40 pin chips (includes CPU, GTIA, ANTIC, PIA, and POKEY) for $4.95 from American Techna-Vision (510-352-3787). The Antic chip is labelled CO12296 or CO21697. It worked for me and they sell other useful parts like power supplies, trakballs, 1050 mechanisms, etc.

From: Glen_Greenly@mindlink.bc.ca
Message-ID: <46mrsb$g4r@fountain.mindlink.net>
Source record: 87883

Is there any support and/or capability within PC-Xformer to run cartridge based software? I'm only looking at version 2.52 right now, and I haven't read the docs fully yet (what a fool), but I'll be getting 4.0 as soon as practical.

I'm sure one would have to get the software off of the cartridge first, but then...what? Support for 8K, 16K, and 24K (bank selecting like OSS cartridges) is kindly added to PC-Xformer, and kind/brilliant Atarians come out with software/hardware to get the software off of the cart? Of course, we would only do this if we owned the cart for copyright reasons, but can it be done? (Or has it? I better get back and read those docs...sorry if I'm wasting bandwidth :-).

Glen Greenly.

3364. Re: Can PC-Xformer run cartridges?

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-26 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <147344@cup.portal.com>
Source record: 87886

At least for 8k carts, all you have to do is rename the BASIC.ROM
file & name the ROM image you want to run BASIC.ROM & it will boot.
I have Action! running on the emulator, but it not that good compared
to a real Atari/Action! cart so IMO: Not reccomended. The disk based
MAC/65 has been released as shareware so the only thing you can't run
is the BASIC XL & XE carts, & that's only to the best of my knowledge.
BTW: The Action! version I have, in addition to the two real carts, is
not available.
The easiest way to get a ROM image is by replacing the OS chip with
an aftermarket modified one. But these are expensive, >$40, and are
of more use if you program as far as time using them goes. A lot of
stuff will only be available if you are willing to do it yourself.
We're an odd lot here, just about entirely made of of people that are
either professional programmers, arts, science, ... what have you.
Consequence is we all pretty much believe in the copyright laws.
That being said, if you want to try making a ROM image w/o laying out
any bucks & you don't have a model 800, first you need to get lucky.
There was a brief time period where Atari was making socketed carts
with 8k ROMs vs two 4k's or soldering the chips in. If you check
& find you have both a BASIC & something like Galaga, the Galaga
cart, even though it is only an 8k program is a 16k cart. Atari
got cheap & only used the 16k board for a *lot* of their game rather
then come out with an 8k one. Pull the ROM from socket & put it
in the other side then pull the ROM from the BASIC cart & insert it in
socket where the Galaga chip was originally. Now when you insert the
cart, you will come up in BASIC, but the other ROM will be at
$8000 to $9FFF & you can do whatever you want with it.
Rick

Source record: 87890

This newsgroup has a growing amount of bandwidth being used
for people selling stuff. J. Manazer, Michael Novak, Ben
Smith are monopolizing the group. I suggest, that if anyone
wants to buy/participate in purchasing/bidding that they go
to the appropriate group, like rec.games for 2600 stuff or
sale.misc for swapmeets in Oregon. In fact local swap meets
don't belong here anyway, they should be posted on local
BBSes. The news.announce has guidelines on selling stuff in
usenet. The guidelines state that sales should be BRIEF and
appropriate to the group. That the person posting something
for sale should be a regular participant in the discussions
of the group and not just a regular contributor of for sale
posts. It is sort of similar to someone standing up during
a town meeting and reading an announcement to get patrons to
a restaurant during a discussion of paving the streets.
They then leave, taking no part in the discussion of paving
the streets.
I think some of these people will continue to post their
sales pitches regardless of whether they get any responses
or not, they're just that obnoxious. Nevertheless, I
suggest that no-one respond to any of these 'commercial'
type lengthy posts. A boycott if you will.

The only one I've actually seen is SALT II, and only in a file format, not as an actual cart. This works mainly on 400/800, some functions are not right on XL/XE systems. It has no error codes, but is pass/fail on functions. It also has some nice alignment type features like color adjustment so that your Atari has the same color as the next guy's.

Maybe this can also be found on the ZIP FAQ but, what is Zip tool? Software?
XE compatible?

Howdy folks

I have seen these "diagnostic cartridges" advertised in Atari Classics and
in a couple a catalogs.

What do they test?
Are they for the electro-dudes only?
Do they produce "error codes" which can be looked up?
etc.,
etc.

A week or two ago, they showed a utility for PC's on a television computer juppie series, that could read out load files. Especially made for the blind. Don't know what kind of PC was required, but I guess it only runs on a mega bucks machine.

I've got READIT by Tom Hunt. Runs under SpartaDOS only and will read out any file you want. Only problem (apart from the "Sparta only" curse) is that it expects an English text (texts in other languages while be pronounced as if it was English. Sounds really funny)

READIT is share-ware btw. I doubt that the PC utility would be that cheap.

If you use either "Re: ..... " or quote (part of) the message (which is really
easy with these QWK readers), you don't need to go back to a previous message.
I very rarely answer a message on-line. It saves online time. And online time
is money, even if you only have to pay the phone company.

C >
C >
C >I looked the Closer To Home BBS directories searching the FRAG, but found
C >nothing. Where I can find this program and defragger mentioned above, if it
C >exists?

Howdy Konrad

I've looked through the filelists I have of Closer To Home, but I guess there
is no defragger. I'll have to ask Tom Hunt (the SysOp) he should know. And if
he know that people want it, he might write a defragger in the future.

FRAG.SFX is in filesig 7 (World of CTH)

It only give info, like "how many bitmaps", and shows graphically how the disk
is fragmented.

You can also find it at BecoTel. (Maybe Bernard Kok could tell you
what his phoe number is, he's the SysOp of BecoTel. I let BobTerm do my
dialing, so I never really learned his number. Although I call there atleast
once a week. BecoTel is in Amsterdam, the Netherlands BTW)

?? A quick question here: How are you billed for on-line time and
phone service?
The reason I'm asking is because I do almost Everything on-line. The
phone call is a local call and costs nothing above the normal monthly billing. My
Internet service provider is paid a flat rate, no limits on time of day nor number of
hours on-line per month. Let's see, normal phone bill, $28 per month, includes
Call-waiting, Tone dail and Caller ID and Taxes. Internet provider, $24.95, Dynamic
PPP.
Just wondering, Rich Mier

Source record: 87760

I am building the sio2pc cable and I am getting alot of errors like 144
and I think
128.. When I try to load basic files i get Error 21 and sometimes 170..

I have been away from the 8-bit for about 10 years and I found one at a
Goodwill for $3 dollars and a 1050 for $5 dollars,so I baught it just to
see if my old disks still work. Most of them do but I found that some had
a buildup of something on them. Every few disks and I have to clean the
heads with a Q-Tip.

Also,My Carina BBS disk # 2 is trashed..only some of the files
read.Does anyone have the #2 disk?

Can anyone tell me if I can use an external IBM drive with the Atari 800
Xl if you make a cable?

Does anyone know if you can copy Copyright Software to an image file?
I want to copy"Racing Destruction Set" to my IBM.
That was one of the best games in the world.

Thanks alot for any info...

Whoops! I misspoke! I believe should have said Galaxian. Hey, it's been 12-13 years! Not to mention I usually had the larger half of a large combo pizza & a pitcher of beer in me before I started playing the arcade stuff. I used to be an arcade addict, but I got better<g>. The only arcade game I play anymore is Star Gate since I bought the coin op one for $400 years ago and even that is less then a couple of times a year. About the only games I play on my Atari now are older CPRGs like Ultima, AR, ...

3388. Bresenham's line drawing algorithm.

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-27 00:00:00 UTC
From: bbingham@turbo.kean.edu
Message-ID: <Pine.OSF.3.91.951027173945.26466A-100000@turbo.kean.edu>
Source record: 87766

```
Here it is Bill, sorry if there are any typos, if so, let me know and I'll
correct it. I believe it assumes the center of screen is 0,0, and you
will need your own putpixel routine, I have one for gr.8 in assembly.
This is NOT the optimized algorithm John was refering to(Next
project?:)), but a good starting point. For Verticle and Horizontal lines
you will be better off with seperate specialized routines, as has been noted.

procedure draw_line (xstart, ystart, xend, yend: integer);

var x, y, {current x and y coordinates}
d, {descision variable}
a, b, {line displacements in x and y}
dx_diag, {diagonal x step for next pixel}
dy_diag, {diagonal y step for next pixel}
dx_nondiag, {nondiagonal x step for next pixel}
dy_nondiag, {nondiagonal y step for next pixel}
diag_inc, {d's incr. for diagonal steps}
nondiag_inc, {d's incr. for nondiagonal steps}
swap: {temporary variable for swaps}
integer;

begin{draw_line}
x := xstart; {line staring point}
y := ystart;

{Determine drawing direction and step to the next pixel}

a := xend - xstart; {calculate difference in x}
b := yend - ystart; {calculate difference in y}

{Determine whether ending point lies to right or left of start point}

if a < 0 then {Drawing towards smaller x-values?}
begin {Yes, because a is negative.}
a := -a; {Make a positive}
dx_diag := -1; {and set x-movement accordingly.}
end
else {Draw is towards larger x-values.}
dx_diag := 1; {Set x-movement towards larger x.}

{Determine whether ending point lies above or below starting point.}

if b < 0 then {Drawing towards smaller y-values?}
begin {Yes, because a is negative.}
b := -b; {Make b positive}
dy_diag := -1; {and set y-movement accordingly.}
end
```

```
else {Draw is towards larger y-values.}
dy_diag := 1; {Set y-movement towards larger y.}

{Identify octant containing ending point. }

if a < b then {Is y-diff. larger than x-diff.?}
begin {Yes, so swap a and b }
swap := a;
a := b;
b := swap;
dx_nondiag := 0; {Since y difference is larger, x}
dy_nondiag := dy_diag { doesn't change on nondiagonal}
end{if-then} { steps, but y changes every step.}
else {When x-diff. is larger than}
begin {y-diff., x changes every step,}
dx_nondiag := dx_diag; {and y changes only on the }
dy_nondiag := 0; {diagonal steps.}
end{else}
d := b + b - a; {Initial value for d is 2 * b - a.}
nondiag_inc := b + b; {Set initial d increment values}
diag_inc := b + b - a - a;
for i := 0 to a do {Draw the a+1 pixels.}
begin
draw_pixel(x,y);
if d < 0 then {Is midpoint above the line?}
begin {Yes, step nondiagonaly.}
x := x + dx_nondiag;
y := y + dy_nondiag;
d := d + nondiag_inc {Update the descicion variable.}
end{if-then}
else {Midpoint is below the line,}
begin {so step diagonally.}
x := x + dx_diag;
y := y + dy_diag;
d := d + diag_inc {Update the descicion variable.}
end{else}
end{for}
end;{draw_line}
```

The C=128 has a true 80 collumn mode which makes its GEOS more usable. Same with the Apple IIGS which has new modes. The C=64 chipset also has 16 color text which makes windowing so much clearer. Even on an Amiga if you set the bit depth to 1, the workbench is pretty ugly. 16 colors really helps and there are no 16 colors modes on the Atari, obviously GTIA isn't going to work. I think the minimum colors for a workable windows system is 4. That way you can try to get some of the highlights to work. So you are probably talking about blitting a 160x200 screen and probably implementing some unreadable text font or scrolling horizontally. Ugh.

Also, the whole idea behind a windowing system is to be able to manage several tasks that are being run at once. Not necessarily multitasking, but at least task switching. No windows for the 8-bit would be complete without a new task manager and some way to deal with extended memory in a standardized way. If you are only going to run one program at a time that uses the windows, you can just as easily write up the windows with the program itself rather than calling windows routines as if it is an OS extension.

There is so much overhead in a windowing system that you really have to go all out with the extended memory routines because otherwise you are just wasting a lot of memory for no good reason. That's why Diamond GOS was a cart. I mean, Sparta-X is just a CLI and it needs to hide itself on a cart. A windowing system is going to wind up being even more complex, especially if you get into complex object oriented gadget creation stuff.

Unless you want to commit to making this into an OS overlay, then you might as well just play around with the MultiMouse handler for standalone apps.

3394. WANTED: APE info

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-27 00:00:00 UTC
From: sydtech@skypoint.com
Message-ID: <46qqsu$fb8@stratus.skypoint.net>
Source record: 87905

Can someone fill me in on APE? What does it offer that SIO2PC doesn't? Does it have the same functionality that SIO2PC does? If so, is it compatible with ATR files? Who invented liquid soap and why?

Thanks,
Scott

3395. Sparta "XFD" or "ATR" file wanted

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-28 00:00:00 UTC
From: aj445@cleveland.Freenet.Edu
Message-ID: <46rtim$9mi@madeline.INS.CWRU.Edu>
Source record: 87767

Hello,

I just purchased the PC Xformer program. It seems to work
well on SOME programs .. not all, as far as I've been
able to tell.

What I'd like is if anyone has been able to make a WORKING
SpartaDos XFD or ATR file. I'd like to try running it on
the Xformer. For that matter, if you have any favorite
"disk images" that work well (games, productivity, etc.)
I'd be most appreciative if you would email them to me, either
as an "attachment", or uuencoded.

Thanks ... As I get better at xfering files (I have 15 years
of 8 bit files), I'll be happy to exchange files with those
who are interested in doing so.

Again, thanks ... Bill

3396. Rverter plans

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-28 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <147382@cup.portal.com>
Source record: 87768

Has anyone built the Rverter device as described in the docs at umich?
Reason I ask is because it seems like I could modify the current
1489 based sio2pc cable which would make it considerably easier
to build. First impression is it looks like it has a few advantages
over using a sio2pc cable to hook to a modem since it allows for
some modem signals. The author says 19,200 null modem was solid, but
if someone can confirm this connected to a real modem it would
tip the scales for me.
Rick

>Ok - I'm searching for this book! :) And what I recalled was you said
>something about some Pascal code snippet.. I'll take *that* if you have
>it! :)

No, I'm sorry. There's no Pascal in the book. There is quite a bit of
C in there, and there was a C version of the line draw, I think.
However, in most cases, the C version is preliminary and all final
developments to the code are not done until the Assembly version.

3400. Re: What else, lines.

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-28 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <147394@cup.portal.com>
Source record: 87772

Well Bill, you've got vertical, are plenty smart enough to figure
out horizontal, got the Pascal source for lines. One last snippet
from the Tech ref:

```
While pixel [row, col]=0 do
begin
pixel [row,col] := fildat;
col := col +1;
if col > screen right edge then col := 0
end;
```

Not much, but its the description of the fill routine. It requires you
to have the right edge of the area to be filled with the pixels already
set, but then I'm sure you used the Basic fill routines already. You
probably could do better with your own routine using Hlines though IMO.
IMO<again> if you're really concerned about speed, don't use any of
the graphics call from Action! I spent some time yesterday looking at
them & all of them just call the OS routines => they won't be that
much faster the using basic, just a little quicker getting there followed
by identical performance.
Rick

Date: 1995-10-29 00:00:00 UTC
From: sknox@us.oracle.com
Message-ID: <46v3cj$ft2@inet-nntp-gw-1.us.oracle.com>
Source record: 87774

Im having a problem with Xformer 3.0 that has gotten worse under 3.2 and I was wondering if others are having the same problem.

It occurs when trying to change disks via the F11 disk selection screen. Under 3.0 I would swap in 10 - 15 .ATR files converted via SIO2PC. Then, when I would try and change the disk, it would always return as 'unused', even though I entered a valid disk image. Under 3.2, this is happening with only 4-5 disk changes sometimes(kinda tough to play disk swapping games).

Anyone else experiencing this? Its happening on my 486-33 desktop and 486-100 laptop.

Thanks
SK

I and others have proven that even 40-column text in 160x200x4 mode can be
quite readable. (Look at Donkey Kong.. then forget ever seeing it :))
I see a nice grey-scale mode where you have nice 3D buttons (hehe) like this:

White highlight
Grey background
Dark grey shadow
Black text

Ah, but then again, who is to say that the actual windowing and graphics
are going to be done on an Atari! And even if you were to upgrade your
Atari with some rare super-duper SVGA <heh> upgrade, you'd STILL be able
to run all of the old software for the windowing system because, technically,
the software should care less about what the windowing system is like or is
capable of... :)

>Also, the whole idea behind a windowing system is to be able to manage

Ah - I went insane with this and not only is it running a number of tasks,
but they are runing SIMULTANEOUSLY - more-so than even a PC or Mac could
do! :) That's cuz the current setup would be multiple Atari's using one
windowing-system-manager :) Read my home page- or just think of X-Window.

>There is so much overhead in a windowing system that you really have to
>go all out with the extended memory routines because otherwise you are
>just wasting a lot of memory for no good reason. That's why Diamond GOS

The memory being taken is on the SERVER (the machine running the Windowing
system) NOT on the CLIENTS (the machines running the applications FOR the
Windowing system)

>was a cart. I mean, Sparta-X is just a CLI and it needs to hide itself
>on a cart. A windowing system is going to wind up being even more

3405. TON OF ATARI STUFF FS IN NJ

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-29 00:00:00 UTC
From: deiss@trenton.edu
Message-ID: <47105v$roj@shell.monmouth.com>
Source record: 87777

I Have a pile of Atari equip. in Monmouth County New Jersey.
EVERYTHING MUST GO!

Here is what I have...

1 130 Computer (Works perfectly.)
4 800XL Computers (I believe all work perfectly.)
2 800 Computers (At least one should work.)
3 1050 Disk Drives (I believe they all work.)
2 RANA 1000 Disk Drives (I believe both work.)
2 Percom Data Disk Drives (I believe at least one works.)
1 850 Interface Box (As far as I know it works.)
2 CX85 Numerical Keypads (Perfect Condition)
1 Totally Awsome, SUPER-DUPER, 410 Cassette TAPE DRIVE! (Probably
very dead.)

I of course have a pile of power packs and cables to accompany all of
the above.

In addition I have a few disk filers full of software, condition
unknown, but I know that some works. Also, I have a few cartridges
such as Atari Writer and Star Raiders.

PLUS I have a few books and manuals which includes a somewhat valuable
800XL SCHEMATIC AND SERVICE MANUAL.

SOMEBODY MAKE ME AN OFFER FOR THIS STUFF!
I would rather sell the whole pile all at once, but I might be
pursuaded to sell a part or two for the right price. EMail me.

Thanks all!

-Cliff Deiss

James King <jeking@xmission.com> writes:

>I dont even know what it is, but I'd be interested in trying it. Where
>can it be found?

It can be found at the atari archive at umich. It's probably still
under /new. I believe it is called critters.arc.good, though I am not
absolutely positive. Due to Delphi's screwy setup, I couldn't upload it
myself. Bill Kendrick was nice enough to do it for me, but I forget what
he ended up calling it (I'd tried to upload it several times, and had used
up all the obvious names, such as critters.arc, critters1.arc,etc.). All
I know for sure is that the name has /two/ extensions, not one (ie,
critters.arc.something).
Failing that, let me know and I'll send it to you as a uuencoded
file.

updated 10/29/95

I have the following Atari 8-bit software and hardware for sale or
trade.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Postal Service. The shipping
cost depends on both the weight of the package and the distance
that it is traveling. Buyer has the choice of either first class
or parcel post (which is slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 6.00 Atariwriter
$ 6.00 Basic
$ 6.00 Galaxian
$ 7.50 Letter-Go-Round (Sesame Street) [CBS Software]
$ 6.00 Missile Command
$ 5.00 Pac-Man
$ 5.00 Star Raiders

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they

are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$25.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$45.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$35.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$59.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

APE is not an emulator, it's an IBM program that simulates Atari devices
like a 1050 by using the IBM's serial port & a simple cable. The
emulator you probably mean is XF25. It is one of the better emulators
as those things go, but I still prefer a real 8 bit. There is a
registered version of the emulator, version 3.2 that is supposed to
be quite good. The emulators will run just about anything a real Atari
will. For instance, if you liked poking around in Atari Basic vs
pulling out a pocket caclulator you'll feel right at home. If you
want to get the emulator, look for it at atari.archive.umich.edu
in the 8bit area. It has all the info for getting the registered
version also.

3410. updated Atari emulator web site

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-30 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <4734dc$pn7@news1.halcyon.com>
Source record: 87782
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.8bit

The Branch Always Software web site has just been considerably updated.
I've added new pictures of the Gemulator and PC Xformer programs and
their related hardware, more detailed descriptions of the products,
updated the dealer list, and added new sections.

If you are looking for information about Atari 8-bit emulators for MS-DOS and
GEM, or for the Atari ST/STE Emulator for Windows 95, please visit the web site
for Branch Always Software Online at:

http://www.halcyon.com/brasoft/

If you have visited the site prior to October 30th, force your browser
to reload the pages to make sure you grab the updated information.

There is an Atari Portfolio Web page, run out of the Czech Republic.
The URL is http://www.mcc.ac.uk/~dlms/Port/portfolio.html

If anyone is interested, I have more than a few megs of Port program
that are shareware, so email me if you want them. I am also always on
the lookout for more.

There are also more than a few places where you can still buy
Portfolio equipment (email me for the info)

Date: 1995-10-30 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Oct30.144102.27769@wariat.UUCP>
Source record: 87785

(Mark B. shares cas2disk and cartcopy experiences.)
CSA8 had just finished a long thread on copying carts when you posted
your question. I'm surprised that 'Star Raiders' and 'Space Invaders'
worked successfully with cartcopy. They are copy protected carts, as a
are 99.9% of commercial carts (are there any other kind?). Commercial
boot tapes are probably only 90% multiple stage, copy protected boot
tapes. So, my answer would have been, no, there's no easy way to copy
carts or commercial boot tapes to a disk load file. (Except ye dump the
cart or tape and dissassemble it and remove the copy protection code,
and a few other things.) The fine art of 'cracking' carts, disks,
tapes (commercial type.) was discussed and generally frowned on as at
least encouraging copyright infringement if not a bad thing to talk
about all by itself.)

Hello all. I was wondering if any of you Atari gurus wouldn't mind lending a hand to a returning old hand at Ataris. I picked up the xformer 2.5 thing, and it looks really cool, but it's been a while since I used an Atari (and I was just a little kid at the time. I'm 19 now) and I'm completely new to finding and using stuff off the internet for the Atari. (like I don't really know how to use those .xfd files and such...) If anyone has the patience to help me out, I'd really appreciate it. Please email me if you can help. Thanks so much {=^)

>I do? (from both sides. Software and Hardware)

I would also like to do this eventually.
But why RS-485? RS-232 should be fine for 6 feet -- definitely better
than SIO for that length.

Basically, you want to set up a null-modem connection between the two
machines, then set your getty on Linux to listen to the serial port
that the Atari is connected to.

I have a list of error codes (and other info) on the Web at
http://er4www.eng.ohio-state.edu/~funkr/Atari/Ref/

But off the top of my head...
144 means you tried to write to a write protected disk...
128 means you hit break during I/O...
21 means you tried to load a file that isn't a SAVEd BASIC program
170 means "file not found"

```
: There is an Xwindows version which I hear is good, but the real killer
: one is the one for the Amiga. It's supposed to be the best Atari 8 bit
: emulator out, ... [rest deleted]
```

Really ? I tried an earlier version a month ago and it was dog slow
even on a 50 MHZ 030 A1200. The problem with this emulator is portability.
Writing an emulator in C simply consumes to much processing power,
to even come close to the original A800's speed. I order to be of any
value to the Amiga community, this emulator needs to be completely
rewritten in assembly language. Even if you have a 060 in your Amiga,
the AGA chipset still consumes too many processor cycles, to allow for
a C-implementation. Take a look at the new C64-emulator A64 for the
Amiga. This one is 'a real killer application' for the amiga.
It's implemented completely in assembly and uses special graphics
routines to account for the Amiga's planar display structure.

Source record: 87796

(Joe Walsh asks if people have used his 'critters' and if
people would like to see him put the finishing touches on
it.)
Ahhh..... Mr. Walsh. Can't say I've used 'critters'. Can't
say I remember what it is. Seems like, memory being what it
is, that it is a 'Akita Life' type program that makes
bacterial growth culture like graphics. If it was on a
local bbs, I probably would download it and run it, just to
see what it is. But, not having a unix shell, FTPing is a
bit involved and I don't even know the EXACT
directory/filename.etc.??? to get it. Now, if you wanna
uuencode it and put it in my mailbox, I'd be glad to run it,
as I can't seem to keep my A8 under the table where it
belongs right now as I am supposed to be constructing a
complicated doll house to fulfill a childhood dream of a 65
year old female friend. My wife bought the doll house for
her last Christmas and leaves it up to me to build it.
So, yes, I'll take it if you wanna send it, but if you're
busy, that's ok too. Now, if anyone tried my 'pcutil'
(probably J. King did, or he was scared off by the 'use at
your own risk' notices.) Oh... where was I, yes tried
'pcutil', it works sorta, but I never got any feedback but
Tom Hunt telling me on CTH to try to get it in shape. I use
it anyway to transfer files from pc to a8. It is designed
to not have errors and I don't have to fool with MyDOS
(being pretty much a SpartaDOS man.) And finally, I've
decided that sooner or later I'm going to put together a
zip/unzip from what I have and forget 'defatex/inflatex' for
the time and try to make a zip/unzip for a8 use. I realize
that the original purpose was to make a unzipper that people
could unzip text they download from pc bbses, but all those
will be deflated. I ramble.

I've got a bunch of Atari 8-bit hardware and software that someone
out there may want. I'm in Atlanta GA, but can ship this stuff if
you aren't close to me.

130XE Computer
400 Computer
810 Disk Drive
MIDI interface and software
Games (cartridge and 5.25" floppies)

$ Cheap $

3429. What is the ANTIC chip for?

Newsgroup: comp.sys.atari.8bit
Date: 1995-10-31 00:00:00 UTC
From: DreamZS@ix.netcom.com
Message-ID: <474841$7an@ixnews4.ix.netcom.com>
Source record: 87801

Just two simple questions.. what is the ANTIC chip for and what does
ANTIC mean? It is found on ATARI computers. Please let me know.
Thank you.

Is your MUX window program functional yet? I rebuilt my computer room
(added an oak rack to house 8+ computers), and set my MUX system back
up.

I'd be interested in trying your program.

Source record: 87804

Since when does one need FOUR colors to do windowing? The original Mac, before color came in, did it with TWO. Or, ONE, "not counting the background." You can simulate "shades of gray" with halftoned or dithered patterns, if you want 'em.

The real problem on the Atari would seem to be that its "high-resolution" graphics mode ISN'T very high-res by today's standards. And then there's artifacting, which effectively HALVES the horizontal resolution even so.

Perhaps the best solution would be an "Antic Mode E" screen -- what we old-timers used to call "GRAPHICS 7 1/2" and which was later built into the XL series as ... I forget which Atari BASIC "GRAPHICS" mode. The highest-resolution (160*160 ?) four-color map mode. This would give you essentially the same resolution as Antic Mode F (GRAPHICS 8), but WITH the capability to explicitly control colors rather than relying on artifacting.

Just my two cents' worth; have a great day!

Heh. That's true. :)
The only things I was thinking of adding would be a title screen,
another line at the bottom of the screen where you could get readouts of
the genetic code of objects under your pointer-box, and ...well, that's
all. :)
But you're right,even with the additional information, it wouldn't
be something to run for hours at a time. :P

I know that there is a programming system for the Atari 8-bits called Action! and I was wondering if anyone could give me a quick run-down on it? For instance, what mainstream languages is it most like? Is it compiled? Is it available on any other platform? Who developed/owns it? Thanks for any information you can provide. Oh, last: does it come on disk or cartridge?

.

Action! was one of my favorite languages and development environments:

It is reminicent of C in that it is very simple, has few keywords,
increment and decrement operators, and strings and I/O are supported
through libraries, not language primitives. On the other hand, it
distinguishes between procedures and functions, like Pascal, and uses
keywords where C uses punctuation. Here's an example snippet, the "Primes"
benchmark from September, 1981 BYTE Magazine, as implemented in ACTION!,
taken from page 205 of the manual, with some notes by me in square
brackets (please ignore any typos):

```
DEFINE size = "8190", ; [defines a constant/macro, like #define in C]
ON = "1",
OFF = "0"

BYTE ARRAY flags(size+1)

CARD count, i, k, prime ; [CARD is a 16-bit integer]

BYTE DISPLAY=$22F, ; [DISPLAY is at memory address $22F]
iter,
tick=20, ; [tick is at memory address 20]
tock=19 ; [tock is at memory address 19]

PROC Primes()
DISPLAY = 0 ; [turn off display hardware to speed execution]
tick = 0 ; [reset hardware timer]
tock = 0
FOR iter=1 TO 10
DO ; [similar to C's "{", or Pascal's "BEGIN"]
count = 0
; turn flags on (non-zero)
SetBlock(flags, size, ON) ; [library function like C's "memset"]
FOR i = 0 TO size
DO
IF flags(i) THEN
prime = i+i+3
```

```
;PrintCE(prime) ;Uncomment to print primes
k = prime + i
WHILE k <= size
DO
flags(k) = OFF
k ==+ prime ; [like C's "+="]
OD
count ==+ 1
FI
OD
OD
i=tick+256*tock ; [tick and tock are bytes of a 16-bit timer]
DISPLAY = $22 ;turn display back on
PrintF("%U Primes done in %U ticks %E", count, i)
; [formatted output like C's "printf"]
RETURN
```

(Hmmm, that was a blast from the past! :-)

It is compiled to 6502 object code.

As far as I know, it was only available for the Atari 8-bit computers, though I have a vague recollection that someone told me they thought it was made available on some other platform as well (maybe Apple II's or IBM-PC's).

It was sold by Optimized Systems Software, Inc. (OSS) and also copyright Action Computer Systems.

It comes on a cartridge that contains an editor, compiler, linker, debugger (monitor), and runtime library. Additionally, there is a disk available with utilities and a runtime system library that allows you to distribute software without requiring the cartridge.

14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM,

ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

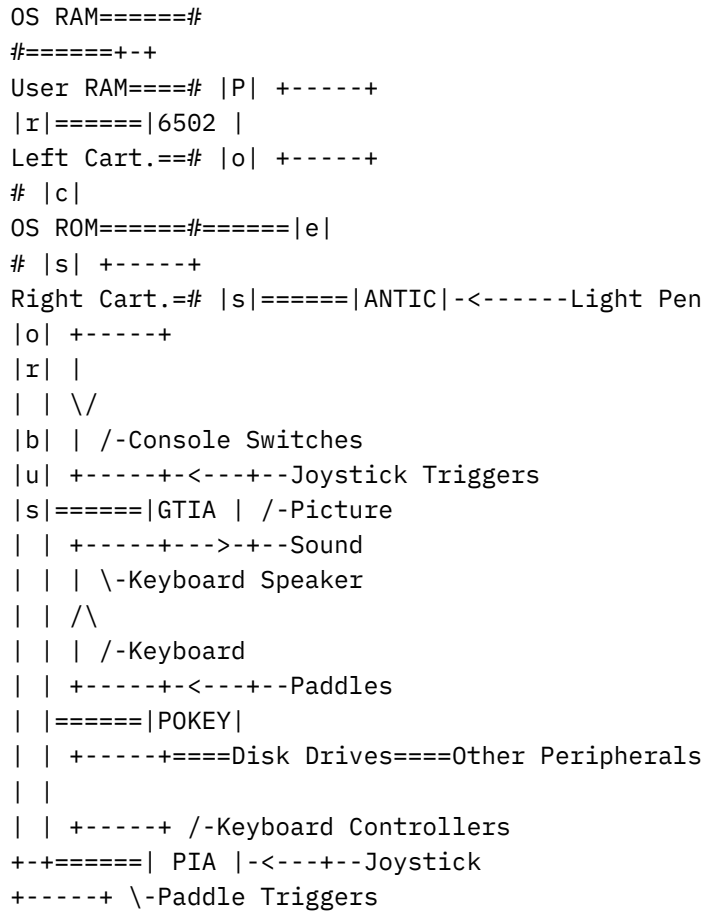
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexor. According to URL:mailto:sup8pdct@closer.brisnet.org.au (James Bradford), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is

beyond me. An 800XL can look like a 130XE with that 16-pin chip installed
(That's right NO freddy) and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, URL:mailto:kendrick@sonoma.edu , for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text

2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen
modes are available.
Screen modes can be mixed (by lines) down the screen using the Display
List (a program which is executed by the ANTIC graphics chip every
screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.
All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

According to Doug Neubauer (by way of URL:mailto:finneganj@delphi.com (James
Finnegan), here is the team that originally designed the Atari 400/800:
<quote>

The A800 VLSI hardware guys include:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators (from the grass valley group)
Joe Decuir - Antic and system and creator
A french guy (whose name I forget) - Antic logic designer
George McLeod - CTIA and GTIA logic design

Doug Neubauer - Pokey logic design
Mark Shieu - Pokey chip design
Steve Stone - Pokey layout design
Steve Smith - Technician for antic and gtia
Delwin Pearson - Technician for Pokey

There were a number of other people whoses names I have forgotten.
I have lost touch with most of them.

<end quote>

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through URL:news:comp.sys.atari.8bit . This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

comp.sys.atari.8bit is archived by the INFO-A8 list server.

Subject: 2.2) What is comp.sys.atari.announce?

URL:news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from URL:mailto:lexicor@world.std.com .

Subject: 2.3) What is comp.sys.atari.advocacy?

URL:news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

URL:news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

URL:news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

URL:news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at URL:mailto:emulators-request@qualcomm.com .

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

URL:mailto:atari8@netcom.com

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, or to start a new thread, send your posting to:

URL:mailto:comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Postings sent in this way automatically appear on comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to atari8@netcom.com will NOT be cross-posted to comp.sys.atari.8bit, so don't send your posting there. The Moderator hopes to correct this in the future.

The Info-Atari8 Digest is archived by the INFO-A8 listserver.

Recent copies are also kept at URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd,
URL:mailto:snyder10@convex1.TCS.Tulane.EDU .

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this
discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
URL:mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to

URL:mailto:comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Postings sent in this way automatically appear on comp.sys.atari.8bit and in
the Info-Atari8 Digest.

Any postings sent to info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach
comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command
to LISTSERV@MARIST, or by sending a message to
URL:mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please
note that this command must NOT be sent to INFO-A8@MARIST or to
info-a8@vm.marist.edu.

---The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8---

You can obtain a list of the available archive files by sending an "INDEX
INFO-A8" command to LISTSERV@MARIST or by sending a message to
<URL:mailto:listserv@vm.marist.edu that says "index info-a8". These files can
then be retrieved by means of a "GET INFO-A8 filetype" command, or by
using the database search facilities of LISTSERV. Send an "INFO DATABASE"
command for more information on the latter.

Recent copies are also kept at
URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason
Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
URL:mailto:ravi@mcnc.org (Ravi Subrahmanyan)
URL:mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you get started using it, try this example of retrieving files from the Merit/Umich Software Archives (through the barnone.citi.umich.edu mirror site). Send a message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.4) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own ways for addressing syntax. The most common one is:

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit', address the message to comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Mail-to-news gateways of this sort tend to be overloaded. Therefore, please do not use these gateways or any other similar gateways if you can post to Usenet directly.

Subject: 3.5) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com (Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Jody Lenn, mailto:lenn@atari.archive.umich.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

URL:file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

URL:gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
URL:gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
URL:gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/
URL:gopher://gopher.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari
/8bit

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

URL:http://www.umich.edu/~archive/atari/8bit/

A mirror web site:
URL:http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

URL:ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
URL:ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
URL:ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
URL:ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
URL:ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit/
URL:ftp://barnone.citi.umich.edu/atari/8bit/ (<-- RECOMMENDED)
URL:ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
URL:ftp://ftp.toad.net/pub/umich/8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn). Please name the parts in the subject line. This is really helpful as the parts usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to have seen no uploads for years, but there are some files here that aren't

on any of the other sites. [IS THIS SITE LOST? - 10/13/95]

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen, mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves them to the appropriate directory. Please include a .readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson, mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock: ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the QACE Archive?

The Queensland Atari Computer Enthusiasts have a fairly large FTP site. It is located in Australia and is the local internet sight of Super Products. Contact James Bradford, URL:mailto:sup8pdct@closer.brisnet.org.au for more info.

URL:ftp://203.4.149.98/8bit

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu (Atari SIG).

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari Users SIG?

National Capital Free-Net (Ottawa, Canada)

Internet access to NCF is via

telnet://guest@freenet2.carleton.ca (134.117.1.39) type "go atari" at any menu
telnet://guest@freenet3.carleton.ca (134.117.1.22) type "go atari" at any menu
gopher://gopher.ncf.carleton.ca and choose:
'National Capital Freenet (NCF) Information by Gopher'
http://www.ncf.carleton.ca/freeport/sigs/computer/atari/menu/

This is the Atari computer(*) users special interest group.

Select the Bulletin Board for the latest Atari related news on the SIG
To get information on the other options select the menu option in question
and read the ABOUT message.

For more information, please contact Jack Kitowicz (ac382) on the
National Capital FreeNet. Comments & Suggestions for improvements to the
Atari SIG are always welcome.

Subject: 5.4) What is the Victoria Free-Net Atari Computer Users SIG?

Victoria Free-Net (Victoria, Canada)

telnet://guest@freenet.victoria.bc.ca (199.60.222.1)

type "go atari" at any menu

Facilitators: Gord Hooper (mailto:ua558@freenet.victoria.bc.ca)
Ted Skrecky (GCACE Librarian)
(mailto:ud264@freenet.victoria.bc.ca)

The aim of this SIG is to assist Atari Computer users. We can provide assistance with XL/XEs, STs, and Falcons, whether you are a new or experienced user.

Subject: 5.5) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.6) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100 terminal. Log in as www. Does not allow users to "go" to arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on your system if your administrator has not done so already. The best plain-text browser, so move mountains if necessary to get your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest of the world. The line mode browser, plus extra features. Log in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

8-bit Vendor/Developer home pages are listed in the Vendor/Developer list, not here.

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu

http://www.yab.com/~bosco/

Queensland Atari Computer Enthusiasts
James Bradford, URL:mailto:sup8pdct@closer.brisnet.org.au
http://203.4.149.98/atari/atari.html

Subject: 7.9) What IRC channels discuss the 8-bit Atari?

#Atari8 - Just for 8-bit Atari users!

#classic - Classic Games and Systems Collectors.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
filenames: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing
platforms?

These are the four emulators that are usable.

1) ST Xformer 3.0, from Branch Always (see companion Vendor/Developer
List for complete contact info). A freeware 8-bit Atari emulator for the
Atari ST.
Net location?

2) PC Xformer 3.2, from Branch Always (see companion Vendor/Developer List for
complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2.
Versions 2.0, 2.5, 2.52 are freeware; 3.0 was the first commercial version;
3.2 is the latest commercial version; 4.0 is scheduled to be released in
October '95.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

filenames: Xf2/xf2.zip, Xf2/xf25.zip
URL:http://www.halcyon.com/brasoft/xf252/xf252.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
filename: Sio2pc/dcm2dsk2.zip

3) Rainbow, by Chris Liam, for the Apple Macintosh
URL:mailto:lamcw@aston.ac.uk
URL:http://www.aston.ac.uk/~lamcw/emulators.html

4) Atari Emulator for Unix and Amiga, by David Firth
Latest version: 0.1.8
URL:mailto:david@signus.demon.co.uk
URL:ftp://ftp.demon.co.uk/pub/emulators/Atari800-0.1.8.tar.gz
(158.152.1.44)

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No

Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
filename: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)

Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
filename: Diskutils/myutil.zip

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC

for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready

5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

Major contributors to this section:

SS SD Warp speed

==> Atari 1050
SS SD/ED 19.2Kbps standard

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track
buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) unknown DOS restrictions

==> Supermax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)
by Super products. Compatiable with superdos and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:

- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
filename: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
filename: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850

830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari
components?

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have. I'm also not sure how much
of this section is valid outside North America. If it's not valid where
you are, I need to hear from you!

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The

power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial
programs. I haven't heard anything about OASIS IV and CARINA for a while,
but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 13.6) What version of Atari BASIC do I have?

Subject: 13.7) What are the Standards for Used 8-Bit Stuff?

Developed by mailto:b.poehland@genie.geis.com (Ben Poehland)

When selling used 8-bit Atari equipment in the comp.sys.atari.8bit/Info-Atari8
Digest/INFO-A8 discussion group, please consider describing the condition of
the materials you are selling using these standards. This will go a long way
toward preventing potentially highly-contentious misunderstandings. Usage is
voluntary, but recommended.

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging
materials.

EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories; heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations, among many others:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html

Evan; Derek gave the XF info. The program APE is only useful if you have
a real Atari computer. IMO: An ideal way to use the stuff that is
out there is to have a real 1050 drive, 8 bit computer, sio2pc cable
for use with either APE or sio2pc software. If you have the hardware
for this, it is easy to make disk images on the IBM. You only need
this set-up for transfering software that isn't available for down
load from a bbs or FTP. For instance, I've bumped into more then a
few people that have requested plans for the sio2pc cable for tranfering
word processing files & data bases as well as public domain software
to their MS DOS computer. Once on the MS DOS computer, the images are
compatible with both the real Atari & the emulator. SIO2PC.COM is
a sort'a free <author only wants $10 shareware fee if you feel like it>
original version of the simulated disk drive. APE is an enhanced version
of the software that is currently undergoing continued development. The
author, Steve Tucker, is a freqent paticipant in this sig. I think
his email address is classics@nacs.net
Of course you don't need the sio2pc interface to run the emulator, but
then you will have trouble getting software from Atari disks to the
PC. Do you have UUENCODE.EXE for your PC?
Rick

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <147470@cup.portal.com>
Source record: 87813

Can't speak for everybody Scott, but for me at least, I have two eprom
burners as well as after market OS ROMs that let me break out of
a cartridge & inot a monitor. I know a lot of people like to use
Chipmunk, a disk based program for deprotecting software. It is
still pricey though last time I checked. We may have a problem with
piracy, but it's the same problem everybody goes through. We probably
should get a little more organised, like make a patch list so somebody
with the software could get it transfered, but we aren't that well orgainzed!
I don't think anybody would mind patches floating around, just not the
cracked games. Maybe something like a sector dump from the first sector
of a game as 'Proof of Purchase' would satisfy people.
Rick

Well, I've started to get a little better at using the
Xformer, and now I wish I had a way to get my old games off of my
disks at home, but their all Single Density formatted {=^(. I don't
know if there's much I can do based on what I read in the FAQ. My
question is, is there anyway to get the great commercial classics like
MULE, Miner 2049er, Archon, and Gateway to Apshai? They're never
offered on r.g.v.marketplace, and from what I've read in the posts,
you guys sort of frown on piracy, so it wouldn't do much good to
ask... What do you guys do? I'd love to know. Thanks for your help.

Pascal, C, many commands from Basic, and the manual also mentions
Algol and Ada, but I haven't seen those. It fits into the procedural
language family. (there's a guy's name attached to this family, but at
the moment I can't remember who.)

> Is it compiled?

Yes, but the cartridge is a complete development environment,
including a wonderful editor (similar to the Paperclip word
processor).
By default, most of your programs need the cartridge installed to run
(that's where the library routines are), but there is a runtime
package available, to let your programs run standalone, as normal
binary files.

> Is it available on any other
>platform?

I've heard rumors of a Commodore version....
I know it was developed specifically for the 6502, and the library has
lots of Atari-specific functions.

> Who developed/owns it?

It was originally developed by or for Optimized Systems Software
(OSS). I don't remember the author's name. ICD had control of it for
a while, so I'd assume that FTe now has it.

And it is on cartridge. "Supercartridge", in fact.

>that the Atari is connected to.

Definatly a good idea. Check umich for the R-Verter plans, and run a nice
80 col Vt100 terminal like ICE-T and you should get very good results.

If you have a problem w/ the old R-Verter handler, try the newer/better BobVerter
handler that is in the BobTerm distribution.

Action! Wonderful language. Russ Whetmore's HomePak was completely
written in Action!

BTW, the name was Nicholas Writh. Developer of Pascul and some other
languag I can't remember. :)

The important thing to realize about Action! is that it appears to have been designed from the start with tight code generation in mind. Features common in other languages, like recursion and structures, are absent, as they don't lend themselves to simple, general implementations on the 6502. The resulting code is very nice, IMO.

Welcome to:

THE UNOFFICIAL ATARI 8-BIT NEW USER, EMULATOR HELP FAQ

Revision 0.95, August 29, 1995

By Bill Kendrick

------------------------------------------------------------------

[ Differences from Rev.0.9: Fixed newdex-friendliness; had to do with
less-than and greater-than character hanging around loose! ]
[ Differences from Rev.0.8: Added the missing list ending tags and
some active links (still trying to make it newdex-friendly! [frown!] ]
[ Differences from Rev.0.7: (Weakly) Converted to HTML! ]

------------------------------------------------------------------

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
[ not done ]
Finally, you can always ask Michael for a copy at
mcurrent@carleton.edu
------------------------------------------------------------------

Summary of Atari 8-bit's and emulated 8-bit Atari's:

* Real Ataris: Atari 8-bit computers were produced between 1979 and
1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when
made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends
when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile
Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC
can be purchased on cartridge for the 400/800/1200XL's.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.0 and 2.5x. 2.0 is limited and supports
only 800 OS. Both public domain (were always PD).
o PC Xformer 3.0x. Supports all OSes, 320K RAM,
```

player/missile collision detection (which MANY games
use!)
+ On Apple Macintoshes:
o Rainbow
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit
machines. Very limited. Now public domain (used to be
commercial).

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard,
non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2,
160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4
graphics are also supported. 40 x 24 x 256-character (128 normal,
128 inverse, character set indirection available) text mode is
standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character
allowed, the other 128 characters have 4th changed into a color 5)
and 40 x 12 x 128-multi-colored-character screen modes are
available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16
hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned)
screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the
Display List (a program which is executed by the ANTIC graphics
chip every screen refresh (60 times per second on real NTSC
Ataris).
* Fine scrolling (both vertical and horizontal) can be enabled on
any line on the screen.
* All other screen attributes (color, player/missile horizontal
position, screen width, player/missile/playfield priority, etc.)
can be ajusted at any point down the screen via a "Display List
Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and
four 2-bit wide, 128 or 256 byte high single color missiles are
available. A mode to combine the 4 missiles into a 5th 8-bit wide
player is also available, as is a mode to XOR colors or blacken
out colors when players overlap (good for making three colors out
of two players!) Players and missiles have adjustable priority and
collision detection (which is not supported by the PC Xformer 2.0
and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3
and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit

volume-only modes can be enabled for digitally sampled sound
replay.
* A fifth "voice" is produced by the internal speaker on Atari
400/800's (for keyclick and buzzer) and in the XL's and XE's this
was (fortunately!) rerouted through the normal audio output, and
the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double
the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten, well, fed up with the XF2-based questions which did not pertain to them, or to the really dumb questions which were in fact understandable to new or rusty Atari 8-bit users, but had just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits [grin]).

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

Since revision 0.7 of this file, Rainbow, an Atari 8-bit emulator for Macintoshes, and "6502", an Atari 8-bit emulator for Unix, have been released, and a 4.0 version of PC Xformer has been announced (and will require Windows 95).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.
2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.
3. How do I turn off BASIC?

To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).
4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!

See "Why doesn't this program load?", above.
5. How do I exit XF and return to DOS?

Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).
7. How do I use MSDOS files with XFormer?

Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS

4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.

Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).
9. What's SIO2PC?

Refer to the XFormer and SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and
Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced Atari 8-bit users).
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents
the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in
MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to
"dir i:*.*")
+ [A] Disk directory (like "dir " and optional output
destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one
place or disk to another, just "[source]" copies from one
place on one disk in a drive to the same place on another
disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted
first) (add ">*.*" or ":*.*" after a subdirectory name to
delete the files within it. A subdirectory name alone will
delete the subdirectory (if it is empty and unlocked)). (Acts
like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but
be careful). (like "ren [old] [new]" in MSDOS - with MyDOS,
use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending
(like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which
boots with the current version of MyDOS you are using and
also has the menu file "DUP.SYS" on it as well). (This is
like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a
quick-format of an already-formatted disk (ie, just a very
fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot
sector, when using XFormer, it's much quicker to just copy
one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it
binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like
"[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ",
etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is
"E477", reset is "E474" (these are the hex values of the
addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from
BASIC, for example) it will write what is in memory to a file
"MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost
forever. When you exit DUP.SYS with the "B: Run Cartridge"
command, MEM.SAV is reloaded and the environment should be as
it was when you left. It's probably quicker to simply "SAVE"

your programs (if in a language) which aren't nearly as big as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly for advanced users or special setups. See the MyDOS docs for details.
+ [P] Set density. Forces a drive to be recognized at a certain density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS) This makes "D:" now the same as a subdirectory or other drive. ie, "D2:" will make all calls to "D:" act as though they are to "D2:" instead. Some programs when prompting for filenames do not add "D:" to the beginning if one is not present, they add "D1:". If you don't trust a program to look to "D:" instead of "D1:" and you want it to look to some place OTHER than "D1:" (ie, where "D:" is pointing which could be a VERY long path list), just add "D:" to the beginning. ALSO, some programs don't even ADD "D:"'s if they aren't in the filenames you give and may give errors (138, for example: device not present, ie, if you said "TESTFILE.DAT" it may think you want "T:" instead of "D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify is on, writes will be slower but 100% reliable. With it off, writes will be much faster but possibly not as reliable (on bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk,

you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the

"root", and all of the "Folders" within it have more windows
in them which also have file and folder icons.

Here's a comparison to using subdirectories on different
DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other
DOSes are not necessarily using drive 1, and MyDOS and
SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the
'current' or 'default' directory to a different place (a
different drive or a subdirectory). "D:" can stand for "D1:"
(like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ
THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files,
multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard
and output to the screen is normally handled. If you
wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using

"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line
into the current program.
* Entering a line number alone will remove that line from the
current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command
followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional

destination device ("D:file.lst", "P:"rinter) and an option start and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
* For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing when it appears. One problem, however, all screens overlay each other so unless you only use certain modes at certain times, parts of some screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text

* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)
* DRAWTO x,y - draw a line from cursor location (set with "POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command colors:
* COLOR 0 will draw using the background color, set with SETCOLOR 4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd into memory locations 704, 705, 706 and 707 (the player/missle graphics color locations). Examples of this will be presented in the BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)
* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor") allows the following characters for editing:

Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)

Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)

Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! [grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.
* When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where

the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
* To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also variations on these are available in most other Atari languages!):
* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary mode 'c'. Channel 'a' must be free or else a 'Channel already open' (129) error will occur. To explain the different "modes", here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"
Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'

* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores the numeric value of
it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed types are
of course allowed).
* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program "Util" on the IBM which can read double-density Atari disks. Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive!

[cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time
anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and
not "ATR"? To keep people from getting confused with the
ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR"
which works on PC's (a PC executable version comes in the archive)
and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

>.
>Will

It is a procedure-oriented program. Maybe Pascal? Something like that.

It is compiled, but many of the functions are in the cartridge. If you use these functions, either the cartridge must be installed, or you must include substitute functions. It isn't as tough as it sounds.

It was developed by an independent developer and originally marketed by OSS. ICD then bought the materials from OSS and the rights from the developer. THEN ICD sold the whole bundle to Fine Tooned, which currently owns (and sells?) it.

It is a cartridge.

3452. 2000 ATR PD/Shareware images for use with SIO2PC/APE/Xformer on one CD

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-02 00:00:00 UTC
From: "Ernest.R.Schreurs" <ernest@pi.net>
Message-ID: <479bkh$37k@neptunus.pi.net>
Source record: 87824

We are happy to announce the availability of the "POOLDISK" CD-rom
for the Atari XL/XE computer. This CD contains the contents of
over 2000 diskettes. Everything is stored in the ATR format as used
by SIO2PC and APE. This is also compatible with the format used by
the Xformer. There are some 250 Megabytes of ATR images on the CD.
To accomodate the Atari ST users, all images are also stored in the
XFD format as used by the ST-Xformer. This occupies another 250 Mb.
These disks include over 250 diskettes from ABBUC, and over 330 from
the BELLCOM PD library. There are also lots of disks from usergroups,
magazines and disk magazines. The Umich.edu 8-bit archive has also
been converted to the ATR format and is now stored in over 500 disk
image files. There are also some files not in ATR format on the disk,
for those that want to try and write an ISO-9660 driver for the XL/XE.
Until someone manages that, you need a PC or an Atari ST to act as
a server for your Classic Atari, or one of the emulators. The
remaining 100 meg of the CD is filled with 165 pictures from various
Atari 8-bit systems and peripherals. This CD is now available from us
for US $ 35, which includes shipping by the cheapest possible rate,
which may take over two weeks. Send a check drawn on an US bank to:
Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands
Make checks payable to Ernest R. Schreurs. Do not fotget to mention
the mailing address, so we know where to send the CD to.
If you cannot send a check, US $ 35 in cash is acceptable too, but then
it is your own risk. If the money does not arrive, we will not know
that you sent any. If the check or the money gets here, we will ship
the CD as soon as possible. A few notes: some of the disks are in
German, Polish or Dutch. As far as we know, everything on the disk is
Public Domain or Shareware, except for the Pokey Magazines and the
Mega-Magazines, which are on the CD by permission, and are restricted
from further copying. You are responsible for whatever is copied off
the CD, if we accidentally placed anything on the CD that is not PD.
If the Jewel box cracks during shipping, this is your own risk. After
all, a new one costs under $1.
If you have any questions, send an E-mail to ernest@pi.net

Scott Butler <sydtech@skypoint.com> wrote:
>Is it fast? Is it better than the best C for the Atari 8-bit?

Fast? Yes.
Better than C? Depends on what you want to do. Judging from your
list, though, I'd say Action is the way to go for you.

I'm a C fan, but C's main advantage is portability across platforms.
Since this isn't an issue for you, go with Action!

Your list is like a checklist of Action features. Not pie-in-the-sky
at all!
You will want to get the runtime library, though.

I received a new issue of Current Notes magazine the other day. The character of the publication is completely different from the past; not necessarily bad, just different.

More distressing was the complete lack of 8-bit support to be found. The 8-bit is mentioned in the masthead, so maybe they hope to include support in future issues.

Here's the new info:

Remember how I suggested that web page maintainers point to the 8-bit FAQ versions at smartpages.com? That was supposed to be the new, best-of-them-all FAQ archive. Well, that site has never updated the FAQs it carries since it opened up last spring. So, the versions that are there are getting stale. Until smartpages comes back to life, you may want to go back to using the FAQs at:

http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/top.html

which has been behaving nicely ever since I told everyone to use smartpages.com, argh...

FAQ: How can I make my commercial boot disk (tape, cart)
into a load file or disk image?

This brings up something I've thought about that probably
has been done, but I am just unaware of it. It may require
some slight modification to the OS, but essentially, all
that need be done is:
1. Load the program from disk, tape, or cart.
2. Break into the BB monitor or some other PBI device that
has a monitor.
3. Dump all 64k to disk, program counter, stack pointer, A,
X, and Y. In other words take a 'snapshot' of the whole
computer, a 'cpu image' instead of a 'disk image.'
4. Write a program to load this image and run it on either
the real thing or an emulated machine.

This should take care of everything except banked carts.
I'm sure these could also be duplicated for use with an
emulator. The technology is here, long ago, just that I
don't know anyone who has done it. I can think of a few
people who would be able to do it, but either they have
already done it or don't want to do it. So, with the proper
software and hardware, one could produce a 'cpu image' and
forget all the copy protection that must occur before the
program is actually in and running. Except for carts. But
I'm sure an emulator could emulate banking and prevent
writes to cart area as well.

All this would be contrary to the interests of the producers
of the current trend of 'classic' games that are selling for
Macs, PCs, etc.

The above would violate copyrights, probably. The old way
of disassembly/reverse engineering is too laborious and
difficult. And Sony Bono and the Republican Congress will
probably make such activities illegal in the new US
copyright law.

So, I'm talking about copyright infringement again. I
started this trying to figure a way to END the questions
about making backups of one's personal commercial software.
The answer might be:
For now, if you want to run copy-protected commercial
software written for the Atari 8-bit, you can only do it on
the machine it was written for, using a disk/tape/cart
slot that it works with. When the software no longer works

and you can't buy it from a vendor, it is lost, the new
breed of programmers/producers will write you a new version
that works on the machines of today. For the future, try to
convince producers that their software is more valuable to
the consumer if it isn't copy protected.

PS. I read someplace Atari sued a cart copy company
successfully. The argument that won was that carts were
ROMs and not subject to failures like disks and tapes. Even
so, my experience has been worse with cart failures than any
other medium.

3458. Atari For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-02 00:00:00 UTC
From: billa@sparki30.ih.att.com
Message-ID: <DHFB2y.MC0@ssbunews.ih.att.com>
Source record: 87830

Years ago I wrote Atari 800 software for Roklan Corp. in
Arlington Heights, IL. I've decided to get rid of all the
equipment, including code listings and source. If you want
assembly versions to perform:

- smooth horizontal and verticle scrolling using joystick
port inputs to determine direction
- program timing using verticle and horizontal blank interrupts
(horiz blank to change character sets on the fly!)
- disk sector read/write/manipulate/examine code
- cassette read/write/boot routines
- player/missile collision detection
- and more ....

this package may be for you.

This whole bundle goes to the highest bidder, shipping is extra.
Email or phone in your bid if you are interested.

Bill Anderson
(708) 979-6155

I don't know anything about it, but I gather from comments here from some of our European friends that there is a hot language available there which is in wide use by advanced developers. Can't remember its name or if it is PD or not. I do recall one of them claiming it was better than Action!. Perhaps one of them could chime in about it again.

James Hague (junkster@coho.halcyon.com) wrote:
: The important thing to realize about Action! is that it appears to have
: been designed from the start with tight code generation in mind. Features
: common in other languages, like recursion and structures, are absent, as
: they don't lend themselves to simple, general implementations on the 6502.
: The resulting code is very nice, IMO.

Is it fast? Is it better than the best C for the Atari 8-bit?

I'm a longtime PC programmer (C, BASIC, some ASM, Windows, VB, etc). I'm looking for a development platform for the Atari 8-bit - not assembler, but not BASIC, either. I'm thinking either Action or some version of C for the Atari. Here's what I want:

- tight, fast code. Could write games in it (w/some ASM, I guess)
- portability; I want to distribute standalone EXEs
- full-featured development environment, preferably integrated enough so that I can edit, comile, and debug from one place
- some sort of support for libraries
- decent support for Atari's special features - sound, graphics, etc.
- integration with assembler routines
- well-written docs with an index and some examples
- did I mention speed?

Is this pie-in-the-sky? Have I been spoiled by years of having nice tools on the PC platform? Which Atari 8-bit development package gets me closest to where I want to be?

Thanks for any and all feedback,
Scott

(Derek from uk wants to convert boot disks to .com files.)
Well, Derek, uhmmm... Well, well, well. Uhmmm... Many boot disks can be converted to com files. Some can't, at least readily or at all because the program loads over DOS. Many of this type get converted to files that you load with a 3 sector 'mini-DOS'. I would guess you want to convert some European boot disk games to .com files for use with XFormer. If these European disks are like the American couterparts, as I suspect they are, they are also copy protected, which means you can't do what you want to do, readily. I don't think your question is for 'budding' programmers, but for experienced 'crackers' and probably this is a fairly often asked question 'how do I convert my commercial, disk, tape or cart to a load file I can use with an emulator.' Maybe the answer should be in the FAQ, but it mostly involves questions of making copyright infringement (also known as piracy, rip-off, thievery, etc.) easier. Rick was talking about patches to boot disks similar to what you get when you un-protect a commercial backup with 'Chipmunk' or 'Black Patch'. In that vein, he suggested maybe passing around patches with some proof of ownership of a legit copy. I forgot. Oh, yes, the only reason someone would need a patch is if they own an original. If they owned a cracked copy (possessed?), they wouldn't need the patch.

Action! still is one of my favorite development environments. :) I kind of
wish for MORE (and even have some plans, as if I could ever do it or something
hehe)

>It was sold by Optimized Systems Software, Inc. (OSS) and also copyright
>Action Computer Systems.

Fine Tooned Engineering now holds the rights to it.

>It comes on a cartridge that contains an editor, compiler, linker,
>debugger (monitor), and runtime library. Additionally, there is a disk
>available with utilities and a runtime system library that allows you to
>distribute software without requiring the cartridge.

The cartridge contains:

Editor - ATASCII-style editor with nice enhancements and more of a real
text-editor interface
Compiler - Compiles source to executable
Linker - There is no linker. There is, unfortunately, no grouping a la
"projects" or "make files" for Action!. So if you change one
thing, the ENTIRE PROGRAM gets recompiled.
Debugger - From what I've heard of other debuggers, this is a VERY poor
debugger. :) I never use it for many of it's features except
to set the editor/compiler options and to compile, run, exit to
DOS or return to the editor. ;)
Runtime - The "runtime library" is technically stored in the cart in the
form of statically-placed executable code. If you tell it to
do something like "print()" or "poke()", it jumps to somewhere
in memory, just like it normally would if you had DECLARED the
procedures/functions, but this place is ALWAYS the same. If you
save your executable, this stuff isn't stored as well (since it's
on the cartridge!) That's where a disk-based runtime package comes
in. It simply REDECLARES the runtime procs/funcs ("print()",
"poke()", etc.) as functions (or even blocks of executable code
(raw data)).

Action! is available from a few vendors. B&C is one of them, I *think*.

Hello to all Atari 8 bit Users.

New Software in from Poland
Wloczkkij translates to VAGABOND.
Produced by AVALON
Music by Tomasz Liebich.
Story Line : Vagabond comes home after a big adventure. He only wants to rest
So he decides to settle in his big comfy chair, then the door bell rings.
Its an alien, his space ship has crashed on entering the earths atmosphere.
None of his passengers are hurt but they are scattered across the Earth
and have to be found before they are discovered by the Earth people.
You have to cope with flying witches, Indians from the big head tribe,
pirartes, fire and evil sharp toothed pacmans.

Recent reviews from Holland details in Twaug mag give this game a 9 out of 10
the graphics are brilliant "Sega Quality.
This game will be on display with many other new Polish titles at the AMS
Computer Show at Stafford Bingley Hall on Sat 11 th November.

All pictures in the pictures directory were made by ourselves. The pictures
are photo's of our own equipment. You are free to use the pictures for
whatever purpose you see fit, we still hold the copyright, but everyone can
use them free of charge. There are a few scan of Atari promotional material.
I suppose they hold the copyright for that. On the other hand, I do not think
they will be selling 1450 XLD's a lot, but we put those on the CD as a
collectors item.

I almost made it through an Action! thread w/o commenting<g>. You can write stand alone programs without the runtime package, but you'd better have a memory map to do it. Just as a for instance, the Atari rainbow I put in with my disk transfer program was written in Action! By all means, go with the runtime package but is kind of a kick working around the routines in the cart or PD runtime package. You have to set up CIOV with something like PROC CIOV=$E456() then do all your setting up of the channel with pointers vs pokes. Your also limited in how many parameters you can pass to a PROC, two I think??? unless you as a minimum use the copy_parm or whatever its called in your runtime of choice. Once again, you'd need a memory map of whatever system you target but you should even be able to use Action! for a cross development system for any 6502 based system. It just spews out an object file compiled at just about any address you want. Contrast this with the Atari C implementations where they usually have the run time compiled at $2400 so you can use any DOS & maybe even an R:handler. Of course you can recompile the C's run time for another address, but it is nice to do it during the compile with Action!
Rick

Ernest.R.Schreurs (ernest@pi.net) wrote a large text
about the ATARI XL/XE POOLDISK. (the text is not quoted)

I have got one POOLDISK CD-ROM (ABBUC JHV with computer fair, 10/28/95)
and I this this is really a good idea.
I am useing this POOLDISK CD with a PC and a SIO2PC-like interface
(called Turbo Link PC). I have direkt acces to the images stored on the
CD, and I can boot them on my ATARI 800 XL. It is really compfortable to use
(but it requires to run two computers). There are some programs for your
PC to make exchange atari <-> PC easier (for example APE (or APC ?), but
this program is shareware and the registration fee is quite high, so I
decided not to use it).
(as mentioned by Ernest.R.Schreurs, you can use all disk images with
the PCXformer without converting files)

I think, that this CD is really usefull (if you own a PC or ST).

Well, I a one question to the producer of the CD:

Are the pictures (containing scanned photos of ATARI hardware) free to
use or are they shareware?
(I want to use one to place it on my web page (as an icon) and I want to
converts some others to ATARI .MIC and overscan-pics)

Last, I have a suggestion:
Is it possible to produce (another) CD-ROM with full versions of comercial
programs? (like the PC yellow point). I do not mean illegal copys - I think
about a encription with registration password for every program.
(well, that requires to write a SIO2PC software that decriptes the encrypted
images "on the fly" and maybe to include the encryption allgorithmus into
PCXformer). I know that this may sound strange, and it will take much time
to get permission from many authors, programming en-/decryption allgorithmus
et.c, and I must admit, that I do not have the knowlegde and time to help

greetings to all ATARI 8-bit users....

Howdi All

I am in the process of gethering up all these damm cheets that are floating
around so I can put them into a single program so they are easier to find!!
All I am asking is if someone has a cheet or walkthou (must be own work because
I will now take something you haven;t typed up yourself) they would like to
contribute, if you do so you will be nentioned and also will be sent a free
copy of the program when I get it together.
Either E-Mail me or Netmail me (E-Mail prefer)

Drew

Today I saw a pale horse with a pale rider.
The horses name was pestilence the riders name was death.

as far a mule goes, I just bet that it is "trips revenge" as many old atarians know,
electronic arts had an obsession with screwing up disks so that they would barely
run.(kinda like cdroms today) it ticked me off then, and still does today.
I have several ea programs, and they all were and remain bug ridden. about
the only ones that worked were the "cracked " copies wher you didnt have to
satisfy some weird programing scheme that prevented cracking a program(none of
them ever did work) and making it run right.
good luck

3483. New Issue of Atari Classics

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-04 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <xFInp5b.ransom22@delphi.com>
Source record: 87852

I received the latest issue of AC today. It's a disk issue. Here are my impressions of it:

Overall: I like it. But, like the last one, it took me less time to read than it took me to make the money to buy it. That's not uncommon in the world of magazines; it's a rare one indeed that takes me more than 10 minutes to read the articles I am interested in. I have one Role-playing-Game magazine that I read cover-to-cover; Business Week is like that for me, too. The rest of the magazines I subscribe to are a waste, and I eventually stop subscribing. Since AC is just about it for the Atari 8-bit community,I had hoped it would be one of the few magazines worth the cover price. I still hope it will become so. It's had a troubled start under the new owner, so I'll give it time. If it isn't better at the end of the second year under his leadership, though, I'll stop subscribing.

Editorial: I was saddened by the fact that the only editorializing done in this part of the magazine was to make apology for the lack of content and quality in this and previous issues. Rather than spending time on this, it would be nice if Mr. Wooley would editorialize about the state of the 8-bit community, or at least reminisce about the "glory days." The comment about keeping the magazine under 5 ounces (to keep postage costs down, presumably) was disheartening as well.

Letters: Like most magazines, little time and space was spent responding to letters. Most letters were merely copied to the page. I hate this practice in the magazine world. Again, AC can't be faulted for this - it's standard practice. The reason for this lack of response is that so many letters of the "you guys are great" type are published. For a loo er, look at what a letters column could (and, IMO, /should/) be, check out an issue of BoardWatch Magazine. The Editor, Jack Ricard, makes it into a forum with a flavor not unlike a UseNET thread.

Solution of the Month: Once again this column has the solution to an adventure I've no interest in. I realize this is a purely personal criticism. Might be that there are a ton of readers out there who are very interested in the solution to "Adventureland." I'm just not one of them.

The Garret: This was a neat, general-interest column. I read it and enjoyed it very much. I don't want to see the magazine filled with this sort of column, but I would love to see one similar column presented each issue.

Tube Baddies: This was a great review. It was balanced, in-depth, and well-written. This type of review is an absolute must for this publication, IMO. Two or three such reviews should be included per issue.

A-T-A-R-I: Another worthwile column. 'Twould be nice if it were not only included every issue, but expanded to two pages every other issue. Paul Alhart can cram good info into two-paragraph mini-essays, and I appreciate his taking the time and effort to do so.

Envelopes, Textpro, Atariwriter Plus: I read the first two paragraphs and lost interest. This is another purely personal preference, though, and I realize that. I have no problem printing envelopes, and have no lack of printers for my Atari that are capable of doing so. In addition, I /rarely/ print an envelope.

SmartOS: I read parts of this article, but didn't put much stock in it, what with the "A Bob Wooley VaprWare Project" disclaimer. What do I care about something that is going nowhere? It would be far more useful to take up that space with something that is complete, or which will definitely BE completed. Say, an article which has been completely written, but which must be spread across two or three issues.

Programming the 65816: Probably nice for those who hve 65816's, but I am not one of those people. So, again, this is a purely personal judgement. I didn't read much of it...just skimmed to see if there was anything relevant to me in it.

I like the magazine, and hope it continues forever. I just want it to improve. By giving my opinions here, I'm probably nixing my chances of ever getting anything published in it, but I think what I've said needed to be communicated.

Source record: 87853

Joe Walsh <ransom22@delphi.com> writes:

>I received the latest issue of AC today. It's a disk issue. Here are
>my impressions of it:

I just tried te disk, and found a really bad error in it: the back
side,which contains the Brundles Demo, is supposed to be self-booting, but
it is not. It doesn't even have an AUTORUN.SYS file on it. I tried
running the various programs on that side, but they are all broken.
CUSTOMIZ.ER runs, but it doesn't actually customize anything, plus it
fills the screen with garbage. BRUNDLES.COM runs, but you only get the
title screen. BRDEMO4.EXE runs, but you can't use the joystick or any
other controller. If these things are "working as designed," it's a
very ineffective demo, but no fault attaches to AC. However, if one is
supposed to be able to play a level or two of this game, then either AC
or KESoft (or both) screwed up somehwere.
This really annoys me, because I had considered buying Brundles
on my next order from B&C (I spend about $250 per month on new Atari stuff
from ATV, B&C, and/or Toad). It would have been nice to see more of it
prior to purchasing it.

Reply to Russ Gilbert comments.
The reason I need to convert Boot Disks to ,com files is quite simple.
Over the last few years of being the only major UK dealer in Atari 8 bit
software I have managed to collect the rights to many 8 bit games including
many new Polish titles.
In 1995 we have developed with the help of CSS the ADDI interface, this unit
allows you to hook up to your 8 bit a standard 3.5 720k IBM type drive.
Or you can attach a 5.25 360k drive.
With the extra capacity offered by these units I now want to complie a 3.5
disk of the titles I have the publishing rights for.
The disk should contain at least 35 good Atari games under 5 menues, single
letter selectable.
I also need help transfering double sided multi disk games down to run on
the 3,5 inch system.
So if you no of any reformed pirates that can put their skills to good use
please ask them to give me a call.
My direct telephone number is 0121 353 5730 that is a U.K number.

James King <jeking@xmission.com> writes:

>Sounds like you and I read the exact same magazines. I subscribe to
>Boardwatch and actively visit their webpage. Do you have a PC or MAC?

I have access to a PC, and I used to use one all the time, but as
mentioned in a previous thread, I gave all that up (gave away all my PC's,
including a 286, a 386DX-40, and a 386SX-20 laptop), keeping only our
486DX2-50 w/32MB of RAM which is solely used by my SO, in order to pursue
only Atari 8-bits. I used to run a popular, single-line BBS on my 386DX-40.
But I shut it down and gave the computer away, as I said. Anyway, that
BBS was the reason I subscribed to Boardwatch - and now that I no longer
have a BBS, I have a subscription to boardWatch until 1998. D'oh! :)

>Same here.. I used to be heavy into Adventure gaming (just bought up the
>last copies of every InfoCom game in existance, but I just dont have the
>time these days to play them...

I still like adventure gaming, although I don't play much. I'd
like to see some Infocom or Scott Adams adventures' solutions in the pages
of AC. Since I am very much enamored of military simulations of late,
a "strategy session" type column on that type of game would be much
appreciated. Is anyone out there willing to write such for AC, fo te
er, for the benefit of we who are less knowledgeable about wargame
tactics? :)

>Yeah.. I too have no interest or desire to pursue the 65816 upgrade..
>Just not worthwhile to me. If I went with a 65816, I'd probably loose
>interest in the 8bit Atari altogether and JUST use my PC. I like my
>ram and OS upgraded XL/XE's just fine..

Since I gave up the PCs, it wouldn't make sense for me to upgrade
the processor in my 8-bit. I mean, if my philosophy is that I don't need
such over-powerful computers, that Atari8's are perfect for me, then I
have no room to argue for a 16-bit processor upgrade, do I? :)

> Does anyone have the cmplete version of sio2pc? With all the docs and
>help files?
You probably have everything there is if you have enough info to buy parts
& start soldering. Sorry, but if you're talking about Nick Kenedy's
ASCII art, that's as good as it gets.

> I built the cable but it isn't working.Is there a way to test it out?
For starters, you can use a volt Ohm meter to check all the pins for
what voltage they have on them. Preferably with the cable both hooked to
an IBM & not hooked up. This will tell if you wired the thing right.
Once hooked up to the IBM, let us know what the status line says
during boot ups.
If you need more help then that, it's almost not worth the postage/drive
to the post office. IMO: It would only cost you something like $.89
at your local Radio Shack to try a different design. You already have
all the parts and then some that you bought for you MAX232 version.
Let me know if you want to try a easier design.

> I really need help. The docs that came with the file is incomplete and
>very poorly written for the new user. I love the 8-bit computer and all
>the files I have for it. I just need help with testing the cable I built.
>I am going to build 4 cables and I baught all the parts for it.
I you really want me to straighten out
> Thanks for any help.
Join the club! I've found the only thing worse then everybody elses'
design/docs are ones done by me.
Rick

3489. 130XE and accessories for sale

I have several items I'd like to unload:

Atari 130XE computer
Indus GT disk drive
Star-Gemini 10X 9-pin printer
Koala Pad drawing pad
Wico joystick
300bps modem (ooh, boy!)
12 cases of disks, including games, programming, art, and utils
5 1/4" disk notching tool
6 carts, including AtariGraphics
NEC JC-1215MA color monitor and cables

I'm asking $250 for the lot, but I'll take offers on the individual components as well. All the equipment has manuals except the monitor, which I may yet dig up.

BTW, I'm in Cleveland.

In article <47art6$1nt@stratus.skypoint.net>,
Scott Butler <sydtech@skypoint.com> wrote:
>
>Is it fast? Is it better than the best C for the Atari 8-bit?

Yes and YES! The C's I've seen for Ataris are stand-alone assemblers and linkers (you need to use another editor.. save, load the compiler, compile, load the linker, link, etc.). What I've seen of C's for the Atari they're very lacking compared to normal ANSI C's. <:^[

(I wouldn't mind GNU C for Unix supporting 6502 or 65816 though :))

>- tight, fast code. Could write games in it (w/some ASM, I guess)

Yes, it's pretty tight and it's the 2nd fastest language, with ASM being THE fastest.

>- portability; I want to distribute standalone EXEs

Yep.. with realtive ease.

>- full-featured development environment, preferably integrated enough
> so that I can edit, comile, and debug from one place

Editor and compiler and monitor (weak debugging facilities) all together..

>- some sort of support for libraries

Duh. :) I mean, umm... of course!

>- decent support for Atari's special features - sound, graphics, etc.

Built-in.. and if you can do it in ASM, you can do it (even more easily) in Action!

>- integration with assembler routines

I suck at this, but yes.. if you know what you're doing. (include raw data as a routine, with ref's to variables, other procedures/funcs and stuff! :))

>- well-written docs with an index and some examples

Docs are pretty good - it took me quite a while to get the hang of it, but I didn't know C (although learning Action! made learning C MUCH easier than it would have been, even after knowing Pascal)

Inotherwords, you WANT Action! Go for it.

Source record: 87715

Well, you know I've been giving it some thought. I believe I can make a
something that would plug into an IBM printer port & copy cartridges.
There's still the moral dilemma of people making mutilple copies for
friends & every pc with the emulator they own. *BUT* at least they would
have to have the cart to make the copy in the first place so they would
have the right to make a back-up & maybe even run it on the emulator
as long as they weren't using it on a real Atari at the same time.
The rest of the problems like the illegal jump cartcopy makes I've
already addressed. I guess if you really want to run stuff made
with cartcopy you could just use the emulator in 800 mode. But sheesh!
damm carts are only $2-$5! It's something I don't need & if I did
make one, who in there right mind would buy it a fair price when you
could pick up a dozen carts for about the same money? Maybe a real die hard
fan of old games, but that's it. I'm still not a real emulator fan vs a
real Atari, but it would be neat if you could boot XF with a cart
plugged in a dongle & have a game come up! Maybe even some application
stuff like Atari Writer or Basic XL.
There's still a lot of stuff people can do with the images that they just
don't realize. For instance, load the things with the /N option then
do a binary save of the cart address space. You could then just strip
the first 6 bytes off & rename it BASIC.ROM for the emulator & it should
work. But I guess I really don't want to spend the time it would take to
hack every silly game people may want to play for 5 minutes & toss.
Rick

None that I know of. Sheesh... if you want to make use of the
technological 'miracle' of running Atari software on a PC you
should be willing to spend a few bucks for it. Darek's Gemulator
is a remarkable piece of software and worth the asking price to
those who need, for whatever reason, this capability.

How soon we forget. Atari's Astroids &, Basketball carts had 4 simotanious joystick modes. Thorn EMI's Hockey & Socker carts had it too. I can't remember, but I think some of the Atari Tennis carts did, I have one but can'tremember. The Thorn's were harder to work, but these were all fun. Now, remember Super Breakout cart could handle up to 8 (!) paddle controllers (two paddles fit one joystick port), but I never tried more than 6 (I didn't have enough paddles!).

I'm sure there were LOTS of others.

If you wanna put up with LINUX there is indeed a freeware
ST emulator for the PC's. You need to supply your own
copy of the TOS however (2.06). It is called STonX.

Don't mind the whiny twat...

|is a remarkable piece of software and worth the asking price to

NOT!

It costs more than some ST's... a significant flaw...

Huh? ROM upgraded 800? You mean putting the XL/XE OS in
a 800? This would have to be a 'Hacked' ROM as the XL/XE uses the Adrs
for Joystick Ports 3 and 4 for the Banked Memory and OS Shadowed Memory.
Intriguing. Has anyone ever tried this?

Rich Mier

3507. LAST CALL - Atari 800 sale

LAST CALL !!! LAST CALL !!! LAST CALL !!! LAST CALL !!! LAST CALL !!!
---------------------------------------------------------------------

Years ago I wrote Atari 800 software for Roklan Corp. in
Arlington Heights, IL. I've decided to get rid of all the
equipment, including code listings and source. If you want
assembly versions to perform:

- smooth horizontal and verticle scrolling using joystick
port inputs to determine direction
- program timing using verticle and horizontal blank interrupts
(horiz blank to change character sets on the fly!)
- disk sector read/write/manipulate/examine code
- cassette read/write/boot routines
- player/missile collision detection
- and more ....

this package may be for you.

This whole bundle goes to the highest bidder, shipping is extra.
Email or phone in your bid if you are interested.

I have a 600xl that has no color, and it is not in the RF modulator,
I am wondering if there is possibly color RAM in the 600xl, or more
likely where is the circuit that handles color (is it chroma or lumina?)?

I need some schematics, or a service manual, or hopefully some testpoints
or components to check out. Any help will be greatly appreciated...

>good luck

I have a cracked copy of MULE here that runs perfectly on the 800xl, but
refuses to run on the emulator (unregistered version). It may be that
MULE is just too complex for the emulator, not that its a copy
protection thing.

How would I get one? New/Used? Documentation?
I don't use my atari save a few times when I pull it out and play some games but I also still think of interesting ideas for programs on it. I had several game concepts I never did get anywhere on. (not that i'm a bad programmer, just more like a non-programmer.. if that makes any sense) Anyway, I would like to perhaps try some programming on it again from my ideas and action is a good start. I know C, and 6502 asm (tho asm has faded somewhat) and action is straight forward, plus I've wanted one for a long time!

So, if anyone has an Action cart and book for sale then please let me know! Obviously, I'm not going to pay a lot for it, but I realise Action carts get sold pretty quickly when they become available... Actually, I haven't seen one on sale here for a long time... do they still exist?? :-)

Into the Eagle's Nest:
Mission #1: Rescue the Prisoner
Blast my way thru doors and enemy. Get DEAD, only 50
hits ends my mission. Several tries, can't hack it. Go to
decoding room. Find $C9, $32 sequence. Change to $EA, $18.
Now have unlimited number of hits. Several attempts to
rescue prisoner. Shoot explosives, blow myself up. Find
prisoner. Run out of ammunition, DEAD. Stupid prisoner.
Gotta shoot him to get him to move out of the way. Several
tries, still haven't succeeded in the mission. Will keep
trying. End.

On the left-front, bottom of the CPU there is a small hole. Thru
this hole there is a small poteniometer (sc) for adjusting the color. What
happens alot is it goes intermittant, dirty. Try a little TV tunner cleaner and move
it back a forth a few times (about 1/4 turn in each direction). Correct adjustment
puts it close to the center.

>>mouse and digital sound support. For more info - mail me.

>Is QUICK another programming language?

Yes, we have just released the english version 2.2.

QUICK is more or less similar to Action, and is almost as fast as Action.
But it is much cheaper, as it is disk based and it always produces
stand alone programs.

Highlights are special commands for writing vbis and dlis without dealing with
the interrupt directly, using a mouse, displaying player/missile graphics,
playing digitized sounds and much more.

So you can do everything that can be done in Assembler, but it is much
easier - alomst as easy as BASIC.

Some programs that were compiled with QUICK are available at ftp.atari.archive.

YES!!! I'm desperate for a way to run the Alternate Reality games... I'd love to have
usable
images, or the aforementioned cable...

>

The Gem 95 Demo is for those who have Gemulator 3(The DOS version). If
you wanted to try out Xformer than download 2.0 which is PD. It's not as
good as the commerical version but worth a good look.

BTW, I hardly ever believe those "coming soon" products which is
probably vaporware.

> What public domain / shareware Atari emulators are there for the PC ?
>
> Where can you get them ?

The only PD emulator is STonX, but you need Linux and a disk file of
TOS(which is the major controversy in comp.sci.atari.st right now).

> Where can you get games for them (which will work with the emulators) ?

I doubt if many games would work emulators except those that use GEM.
Someone did say you can run any game except for copy protected ones on
Gemulator 95, but this cannot be confirmed at this time.

Wow... okay, I've seen Mule (M.U.L.E. to be precise :-)) use 4 sticks, but -- Space Invaders? Pole Position? In my experience, I've only ever seen Pole Position use ONE stick and Space Invaders a maximum of TWO. I'd love to know more about "what's supposed to happen," or "what you can do," using more than ONE/TWO sticks on those two games! How do you initiate, and what is, a more-than-two-player game of Space Invaders? And a more-than-ONE-player game of Pole Position?

Details, man, details!

Writing about 4-stick games for the 400/800, Rob Funk writes:

>Wizards of Wor.

Wow again. As in my last posting, I've only ever seen Wizards of Wor use a maximum of TWO sticks. How do you get it to use more than two, and then what use is made of sticks 3 and 4? Do tell, please!

Oh, there's a game called Survivor that can use 1, 2, 3, or 4 sticks. You fly a spaceship around and shoot enemy guns off a floating framework while avoiding getting shot by them yourself. In a 1-player, 1-stick game, the single stick flies the ship in all directions AND FIRES in all directions. In a 2-player, 2-stick game, stick 1 controls the flying of the ship, and stick 2 controls the firing of the ship's guns, in all directions. In 3- and 4-player games, control functions are gradually divvied up so that with 4 sticks, one stick flies the ship in the "up" and "down" directions, another flies the ship "left" and "right," and the other two sticks share ship's-gun control in a similar manner.

>Just two simple questions.. what is the ANTIC chip for and what does
>ANTIC mean? It is found on ATARI computers. Please let me know.

I believe ANTIC is the microprocessor responsible for drawing and maintaining
the screen display on the atari. I believe its a DMA device, which is why the
atari spends so little 6502 time updating the screen, unlike a PC.

As for what ANTIC stands for, I would look it up in a book but im too lazy. :)

I would guess: Atari NTSC Interface Circuit (Chip?)

Just curious if anybodies ever consider mounting a mux cartridge on the INSIDE of a case.

Reason for this: I'd like to give my ALMOST 1 year old son an Atari XL to play on -- muxed into my network, but know that at this age, the cartridge will be a very appealing toy to play with, and I'd rather get it out of sight by mounting it interally somehow.

Anybody?

Actually, DMA just refers to the fact that Antic retrieves the screen
data from RAM as it draws the screen. A VGA card does the same. The
main difference between a PC and the 8-bit is that the screen is
relocatable in RAM on the 8-bit and that it uses system RAM instead of
Adapter RAM (which has its advantages too).

>I would guess: Atari NTSC Interface Circuit (Chip?)

Close. Alpha Numeric Television Interface Circuit.

3535. Bristles unlimited lives

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-10 00:00:00 UTC
From: cmwagner@news.gate.net
Message-ID: <47uq7t$r6g@hopi.gate.net>
Source record: 87657

I hope to be providing simple hacks that an average user can do to their software, here is one on one of my favorite 8-bit games called Bristles by Award Winner, and I think published by First Star Software, the fix is easy:

offsets 5FB3-5FB5 are the patching area...

```
5FB0 BD
5FB1 7B
5FB2 03
5FB3 D0 4C
5FB4 47 F0
5FB5 A9 9F
5FB6 01
5FB7 8D
5FB8 BE
5FB9 06
```

I searched for the string "BD7B03D047A9018DBE06" with my PC...

The first column is the OFFSET, not address, second column is the original bytes, and the third column is the patch bytes, if necessary.

This will give you unlimited lives in Bristles... If I come up with another hack/trainer then I will post it here.

I'm an Atari ST user. I just picked up a Koala Tablet, new in the box, with cartridge and manuals. Can it be used on an ST? The fellow has two more, which can probably be gotten quite cheaply, as they're in his way and he doesn't know what they're for. I don't either, for that matter. I just thought it might be useful for ST drawing programs, as it has the same plug as an ST mouse/joystick.

If you're interested, email me, or reply in the ST newsgroups, as I don't usually read this one.

3540. Atari Joysticks

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-11 00:00:00 UTC
From: Michael Kling <kling@cis.picker.com>
Message-ID: <1995Nov11.080231.23823@picker.com>
Source record: 87662

Does anybody remember where I can get information on how
to hook an Atari Joystick to an IBM PC? Playing
Donkey Kong with PC-Xformer 3.20 is not that easy with
a Gravis Gamepad. I remember there was a site on the net
that had the schematics available on-line but I can't remember
where I saw it. If anybody can help please e-mail me
direct at

kling@cis.picker.com

Thanks

Mike Kling

It could be that the provider will not accept connection on modems
under 300 baud. You need to ask your provider what the minimum baud rate
is that they will allow you to connect at.

From: summers@newt.CS.ORST.EDU (Benjamin C Summers)
Subject: Interested in an Atari 800 for $60?
Organization: Oregon State University, College of Engineering

I saw an Atari 800 computer with disk drive and tape deck unit all in the
box down at a local thrift store. Would anyone be interested in it for
say $60? If so, please let me know and I'll see if it's still
available. Shipping would be above and beyond the $60 and be paid by the
buyer. The unit would be tested to see if it's in working order before
the purchase becomes final. If you're interested, please let me know.

Yeah.. got mine on Friday. Now, what's the mod for SIO.SYS to get it to
work with the multiplexor? I cant seem to remember the tip/instruction
for accomplishing this.

In addition, what differences have YOU noticed? Shall we compare notes!

: say $60? If so, please let me know and I'll see if it's still
: available. Shipping would be above and beyond the $60 and be paid by the
: buyer. The unit would be tested to see if it's in working order before
: the purchase becomes final. If you're interested, please let me know.

That's too much money, especially if it's an old 810 disk drive. I routinely find Atari 800s for $10 and under at the local Savers and Goodwills. Disk drives are a little harder to come by, but I'm pretty sure they price computer equipment by weight or something! :)

Check back in a couple of days. If you're lucky, it'll still be there (with all the pieces), and they'll have the whole thing marked down to $15 or less....

I still don't understand the Emulators for the 8-bit Atari.
If this xformer program doesn't work so well why do people use it more if
APE allows you to hook up the diskdrive and use it on the PC?

Willthen new xformer (newest version) work with every atari program?
I would like to know which emulator is better for me....

very confused,
Evan...

A few weeks ago, I saw someone selling a Commodore-64 at a yard sale for $50;
that's JUST the C-64, no tape drive, disk drive, or software... I just didn't
have the heart to tell them... :-)

3551. Spartados for NON XL/XE?

Newsgroup: comp.sys.atari.8bit

Looks like I found a version of Spartados.
However, the thing doesn't work on my good, old Atari 800.
Any suggestions where to get some old, old version of this Software.
I'd really like to try the high speed with SIO2PC!!!

Stefan

Hi James,

Just one more thing... You will need to put the CONFIG.SYS file
on the Boot Drive of the MASTER System. Most MUX users have bee
n using 3.2Z or 3.3A and this won't present any problems with getting
configuration files confused.

Mike

3555. SpartaDos for PC Xformer needed

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-12 00:00:00 UTC
From: dickweed@bestbrains.com
Message-ID: <485raj$sk9@ixnews6.ix.netcom.com>
Source record: 87677

Hello,

I've been looking "high and Low" for a copy of SpartaDos that will run on the PC Xformer. I am told that a special version called "SpartaDos 3.2z" was made (originally for the Black Box) with the Ultraspeed I/O stripped out of it (which seems to hose the PC Xformer). None of my current versions of SpartaDos run on the Xformer: 3.2d, 3.2f or 3.2g

If ANYONE has this special version of SpartaDos which will run on the PC Xformer, please let me know where to get it. If you can send attachments, send the program as an attachment to: cooncat@ix.netcom.com.

Thanks .... Bill

Why not write articles for the paper magazines? Why electronic only?

Re: online magazine.

I like to hold the paper in my hand. And it's MUCH easier to look an article
up in a paper mag as it is on a floppy or printout. It's hard enough trying to
find something in my stack of print outs.

PLEASE publisher, keep these things on paper.

[Brainstorm mode ON]

MAybe somebody could come up with a remote controll device that would
eliminate the need for extension cords. You just plug the receiving end into
you joystickports and your favorite joystick/joypad/trackball/pabbles/mouse
into the sending end.

This might even work on SEGA computers and all others that use Atari style
joystickports.

D > Thanks!
D > -Dag-

Sorry but... you need hardware handshaking (or a super clean phone line) with
everything over 4800 baud and the P:R:Connection doesn't isn't able to
do hardware handshaking. The Old MIO is (with some software by Len Spencer),
the new MIO2 will but hasn't come out yet. The BlackBox will. Contact CSS
either via phone or via Email (76702.1076@compuserve.com).

If we can get Bob Puff to rewrite the BB software to do 57k6, Erhard Puetz
will develope some hardware (that 'll fit underneath the 6551) to make the
6551 run that fast. (according to the specs (according to Erhard) the 6551
was built to run at speeds up to 115k bps.)

g >
g >NiCK

It's the "latest" version of the 400/800 series. It will run 98% of th software
that'll run on the 400/800. For the other 2 percent, some "translator" software
will do the trick (unless it's on of the really nasty once which need the
old OS in ROM). Which brings us to t subject of OS's. All computers have an
O.S. except the Atari Jaguar (the super game system)

From: tdrake1@umbc.edu
Message-ID: <483p3g$efp@news.umbc.edu>
Source record: 87692

Just wanted to inform the newsgroup that I just received my SpartaDOS X 4.22 upgrade chip in the mail from FTe and it works great. It will now check for the Sweet 16 65816 board if installed!

FTe also included an Addendum to the SpartaDOS X Reference Manual for versions 4.19 and higher, the XEP80.SYS, using BASIC XE with X, using modified XF551 disk drives, using MAC/65 with SpartaDOS X, using Atariwriter Plus with X, and few more tid-bits and things.

Anybody out there with an older SpartaDOS X cartridge can't go wrong with the upgrade. For those who don't use SpartaDOS X then you don't know what you are missing! Sorry, Bill! :)

(Yes, I too, use MyDOS from time to time!)

Tom

>I still don't understand the Emulators for the 8-bit Atari.
>If this xformer program doesn't work so well why do people use it more if
>APE allows you to hook up the diskdrive and use it on the PC?

One fact should alleviate your confusion:
APE is not an emulator.

I know of four emulators of the 8-bits:
ST-Xformer (for the ST)
PC-Xformer (for MS-DOS)
Rainbow (for the Mac)
Atari800 (for Unix)

APE is basically an extension of the SIO2PC idea:
The Atari uses the PC as a peripheral.

Hi Jim,

SDX 4.22 will only work on the Slave Computer. You will need to change
DEVICE = SIO.SYS to DEVICE=SIO2.SYS in your Config.Sys File, and won't
be able to specify USE OSRAM. Change that to USE NONE on a 64K machine,
or USE BANKED on a 130XE or better. If you are using a 130XE with SIO2.SYS
and USE BANKED, you will not be able to use BASIC XE. On a 256K machine
this is not a problem (with BXE).

Hope this helps, Mike

|> Someone did say you can run any game except for copy protected ones on
|> Gemulator 95, but this cannot be confirmed at this time.

I could run Sentinel on STonX (after correcting a little bug in
the 68k emulator and after removing the disk protection scheme...);
the mouse does not work since the IKBD is used to get absolute mouse
position. I could also run Frontier (though I did not try to use the
game; I just can say I saw the ship and the dome).

In its current state STonX can run the games that don't:
- make FDC direct access (protections for instance);
- change the default working of the IKBD.
The problem of the IKBD could be worked out but I seriously doubt one
could write a perfect FDC emulator since the different computers don't
access their drives the same way (I seriously doubt you can portably
read a whole track...).

j >for accomplishing this.

The thing you really need to do is set the USE to NONE...(stock systems)
Other than that, the new sio2.sys works like a champ when used with
a MUX. Oh yeah, you can only use SDX on the slaves...but hey, that's
not a problem.

j >In addition, what differences have YOU noticed? Shall we compare notes!

j >Where can I get one?

The MUX carts (by CSS) allow you to link up to 8 8-bit systems together with access to common divices...printers, diskdrives and hard drives. With the right software in place, the slaves can chat with each other and or pass needed information amongst themselves. I've used a 4 slave MUX set-up to run reg. at a number of local conventions... Simple, cheap and does the job very well.

> I do? (from both sides. Software and Hardware)
>

I would avoid using RS-485. RS-232 can _easily_ go six meters. Just use
an 850 interface or one of the more recent commerical products (P:R:, BB,
MIO) and some good quality cable. I frequently use >100 foot runs of RS232
with no problems at all. As far as software goes, use whatever you like.

For 40 col work, 850 Express! is still good. Otherwise, BobTerm or
Chamelon all function. You may have to edit your /etc/termcap to add a
specific 800XE entry, unless you use a terminal emulator (ie VT100).

Gads...let me think. There were a bunch at first. I know MULE and
Survivor used all four ports, so did a game of mine, and I think a couple
programs from Atari. It has been too long.

The Corvus HD used ports three and four for it's disk interface.

From: cmwagner@news.gate.net
Message-ID: <488lv1$1kem@navajo.gate.net>
Source record: 87618

Here is the latest revision to the cheats FAQ, it contains about 5 new
cheats.

Cheats, hints, hacks, and trainers for Atari 8-bit computer software
maintained by Chad Wagner <cmwagner@gate.net>
November 13, 1995

Please backup your original software before making these modifications,
because I will not be liable if you fail to patch your software properly.
By applying these patches you are agreeing to accept responsibility for
damage to software and hardware.

You can currently get this FAQ from the following locations...

ftp://ftp.gate.net/pub/users/cmwagner/faq/cheats.faq

Please submit anything that you may have that falls under the purpose of
this FAQ. You can e-mail your submissions to cmwagner@gate.net.

I did not think of the possiblity that some users may have boot disks and
some may have load files, there is now a type field which tells you how my
copy of this program was. Since all references given are offsets, unless
otherwise stated. If you can't find the byte sequences at the offsets given
then try doing a search on the patterns given.

Title: Bristles
Developer: Award Winner
Publisher: First Star Software
Submitter: Chad Wagner <cmwagner@gate.net>
Type: binary load file

Memory map

040A Current player number, apparently used to keep track of up to four
players, and most of the games counters use this as an index counter
for each of the players lives, and other game play information.
037B Lives left, indexed by $040A, for each player.
074E Time left counter for current player.
599D How many lives to increment per level completed.

Unlimited lives

5FB0: BD
5FB1: 7B
5FB2: 03

```
5FB3: D0 4C
5FB4: 47 F0
5FB5: A9 9F
5FB6: 01
5FB7: 8D
5FB8: BE
5FB9: 06
```

This is an easy modification, it only requires 3 bytes to be changed, starting at offset 5FB3. Essentially you are changing the code at this location to JMP $9FF0, which is normally where the program branches to if the memory location $037B is not zero, basically you are making it jump there whether you have no lives left or not, and the counter will just roll over if you die and have no lives left. You will still die when time runs out, but it is very brutal, since it will keep killing you, because it can't break out of play mode due to this modification.

No decrementing of lives*

```
4497: AE
4498: 0A
4499: 04
449A: DE EA
449B: 7B EA
449C: 03 EA
449D: AD
449E: 4E
449F: 07
```

This modification requires 3 bytes to be changed, starting at offset 449A. This essentially NOP's out the DEC $037B code, causing lives not to be decremented when you die. You will still die when time runs out.

No incrementing of lives*

```
5998: BD
5999: 7B
599A: 03
599B: 18
599C: 69
599D: 02 00
599E: 9D
599F: 7B
59A0: 03
59A1: A9
59A2: FF
```

Unlimited time*

```
41D3: AD
41D4: 4E
41D5: 07
```

41D6: D0 EA
41D7: 5B EA
41D8: AD
41D9: 05
41DA: D0
41DB: 29
41DC: 0B
41DD: C9
41DE: 0B

This modification requires 2 bytes to be changed, starting at offset 41D6.
This NOP's out the branch, which causes the program to branch to a routine
which zero's out all counters and let's the lifes gone routine kill the
game. This allows unlimited time to be played, but the border will be
flashing, as normal, once you go below 400 or so ticks.

Title: Moon Patrol
Developer: Williams
Publisher: Williams
Submitter: Chad Wagner <cmwagner@gate.net>
Type: binary load file

Memory map

0023 Lives left counter

No decrementing of lives*

014C: C6 EA
014D: 23 EA
014E: A5
014F: 27
0150: 85
0151: 32

This modification requires 2 bytes to be changed, starting at offset 014C.
This essentially NOP's out the DEC $23 code, causing lives not to be
decremented when you die.

No incrementing of lives*

3014: E6 EA
3015: 23 EA
3016: 20
3017: 36
3018: 83
3019: A2
301A: 00

This modification requires 2 bytes to be changed, starting at offset 3014.
This NOP's out the INC $23 code, causing lives not to be incremented.

Comments

I have tested this and it does definately give you unlimited lives, but I
don't know if you get extra lives in Moon Patrol, I don't recall it, and
for some odd reason the game starts much faster (it normally plays a tune
before you can play), so this might not necessarily be the lives counter,
but it definately gives you unlimited lives. I also do not know how it
handles multiple players, since this is not swapped with another memory
location nor is it indexed, so I am guessing this modification breaks
something related to checking if lives zero or decrease lives routines.

This version of Moon Patrol looked like a 5200 conversion, so it is possible
that Williams converted it from the 5200, or someone else did.

Title: Root Beer Tapper
Developer: ?
Publisher: ?
Submitter: Chad Wagner <cmwagner@gate.net>
Type: binary load file

Memory map

001A Current player playing.
001C Lives left, indexed by $001A.

No decrementing of lives*

0501: D6 EA
0502: 1C EA
0503: F0 EA
0504: 03 EA
0505: 4C
0506: 36
0507: 42

This modification requires 4 bytes to be changed, starting at offset 0501.
This will NOP out the DEC $1C,X code, and the branch-if-equal (BEQ) code.

No incrementing of lives*

16F2: F6 EA
16F3: 1C EA
16F4: D8
16F5: 20
16F6: E0
16F7: 4E

This modification requires 2 bytes to be changed, starting at offset 16F2.
This will NOP out the INC $1C,X code.

Title: Into Eagle's Nest
Developer: ?
Publisher: ?

Submitter: Russ Gilbert <Russ.Gilbert@apk.wariat.org>
Type: ?

Unlimited number of hits*

Search for byte sequence $C9 $32 and change to $EA $18.

This gives unlimited number of hits. You can still run out of ammunition or
hit explosives.

Title: Stealth
Developer: ?
Publisher: ?
Submitter: Russ Gilbert <Russ.Gilbert@apk.wariat.org>
Type: ?

Unlimited number of attempts to fly to tower*

Search for byte sequence $C6 $E5 and change to $E6 ($E5 stays same).

Gives unlimited number of 'attempts' to fly at tower.

If what you really want is the equivalent of what SETVER does for MS-DOS
machines, then it is trivial. Just write $32 to $0700. SETVER doesn't
change any functionality, it just causes DOS to return a different version
number when asked.

In Basic, "POKE 1792,50". In Sparta X, do the same thing but with a
space instead of a comma.

Or use this Basic program to make a binary that will do it:
(I'm a little rusty here, so watch me for any mistakes. I have a
feeling Sparta will try to execute this, too...)

10 OPEN #1,8,0,"D:SETVER32.COM"
20 PUT #1,255:PUT #1,255:REM This is a binary-load file
30 PUT #1,0:PUT #1,7:REM Start address is $0700
40 PUT #1,0:PUT #1,7:REM End address is also $0700
50 PUT #1,50:REM Data = $32
60 CLOSE #1

Wasn't the XM301 an Bell 103 modem? Most newer modems support it, but I
believe it can be disabled and CCITT standards only used. Not to mention
I know I can configure my modem with a minimum speed, but I would at the
very least give a message stating a "policy", rather than not accepting
carrier at all. But I am a nice guy. <grin>

>joystickports.

Sega does use that familiar 9-pin port, but it is not totally the same, if
I remember right. I know it doesn't matter when it comes to most Atari
products, except the 7800, which used negative voltages for it's two
buttons.

The final statement is hard to believe, considering most game consoles have
a API, BIOS, or OS (whatever you want to call it). I don't know much about
the Jaguar, but I seriously doubt it doesn't have some sort of OS. For
common routines, and other things. Such as some sort peripheral interface
routine, or some sort of gamepad routine, and probably many cheap built-in
video routines, like text on the screen, or something like that.

Hi ,

*I've been looking for a version of SpartaDos (3.2z) which will work with the PC Xformer. Standard version WON'T run on PC Xformer, due to the "Ultra Speed I/O" feature. 3.2z version, created for the CSS Black Box, is supposed to be the only version that will work. If you can get me a copy of this, or tell m wherer Ican download it, I'd be much obliged ...

>4. Write a program to load this image and run it on either
> the real thing or an emulated machine.

This has been done. The program is called "The Freezer" and I think it
was done by the person who made Transdisk (C.Gibbons?). He also did
some stuff with cartridge copying and tape copying. He repeatedly
mentioned that these were programs were for "backup purposes only".
I think The Freezer was basically the normal OS with a routine hiding
in the keyboard monitor that looked for a press of the a specific
console key combination as well as a SHIFT-CTRL-ESC combination.
As this was loaded into the OS RAM bank, then any messing around with
PORTB would kill it as would any rogue writing to the OS (just to ensure
the RAM bank wasn't in place). There might be some other way in which
it could have been defeated I guess. Perhaps killing the OS keyboard
monitor and installing your own? Anyway this all of the top of my head.
The long and short of it is that it did create a boot disk copy of the
entire system and it didn't work for anything using any extra memory banks
(including the OS RAM of course).

If anyone has the specific details then please post away - this is all from
my own murky memory banks.

> I have an Atari 800 and the RETURN key does not work. I am interested
> in acquiring a working keybord. I am also intereted in a working 810

The keyboard on the 800 is wasy to fix. If the [RETURN] key is the ONLY key that is broken (check backspace and shift), then you should CAREFULLY remove the keycap and clean the contacts with a contact brush (such as used on relays) or a swap with some 99% Isopropanol (aka Isopropoyl Alcohol, sold in drug stores. DO NOT USE 70% (rubbing alcohol)).

If that fails, try bending the contacts closer together (CAREFULLY), or resoldering the connections on the MB. The keyboard should be easy to fix...that is why they last so long.

If some other keys are found to be nonfunctional, check the cable to the keyboard. Is it firmly attached on both ends? Next check the filter caps tied to the connector on the motherboard. Last, try replacing the 4051 chips. Assuming your POKEY is working properly (sounds like it is), the repair should be simple.

Source record: 87622

I need some help...I am searching for an operators manual for the Corvus disk system.

I have the Corvus drive, and digging through my collection produced the Atari interface, the Atari software and the manual for that software.

What I am missing is the MASTER manual for the drive. The one that talks about how to format the thing, shows the position of the switches, etc. It has been twelve years since I ran one, so it is a bit foggy.

Can anybody out there give me a hand? I am willing to pay $$ for you time to get me a photocopy. Thanks,

Not necessarily, I wrote a similar utility a while back (probably 10
years ago). There is a strange querk with PORTB, as we all know PORTB
is used to enable or disable the RAM area under the OS. Any RAM based
OS could be disable by a game writing to PORTB, but if you changed
PORTB to output using PBCTL, the enable / disable bit became
reversed (I'm only letting on now for obvious reasons). The result was
that a game thinks that it is re-enabling the ROM OS, but is actually
enabling the RAM OS - wierd! (try it yourself)

>
>>>>
About the 810 Disc Drive: What I've found on many 810's,
especially if they haven't been used for a long time, is that the Side Board
looses it's ground to the chasis. There is a "L" shaped bracket that screws
on to the board (2 screws) and 1 screw to the chasis. Loosen and retighten
these screws. Better yet, remove the 2 on the side board and put a 'Star'
washer under them.
The 2nd most common problem is the interface chip mounted on
the side board at the rear (socketed). A LM/CA 3086 chip. If that goes you
won't be able to talk to it, Device Not Available, NAK or something like that.
The cause: unpluging the SIO cable with the power supply plugged into the
810. Doesn't even have to have the transformer pluged into a AC socket,
about 10 % of the time this chip will get blown. Don't even ask! I am not
about to descripe how or why it happens. This can also happen on 1050's
but not near as often.

Yikes, a CTIA. I would reccomend that you replace the chip with a GTIA,
unless you are a collector. CTIA's are rare beast anymore. The GTIA
has additional graphic modes, and yes....they are pin-compatible.

Has anyone here done any exploring in the futuristic graphic
adventure/flight simulator MERCENARY, by DataSoft? This was a very
well done program that came out in the late 80's and was marketed as a
joint Commodore/Atari format (Atari on side B). I would like
to compare notes via E-mail on its mysteries...

Tom.Smith@sdcs.org

3616. Re: Spartados for NON XL/XE?

Newsgroup: comp.sys.atari.8bit

The only versions of Spartados that work with a 400/800 are version 1 and the Spartados X (SDX) cartridge. I don't know if Spartados 1 is available anywhere, but you can get SDX from Fine Tooned. Look for the Atari 8-Bit Vendors List which is frequently posted in this newsgroup.

Here's a little code I ran across years ago for Alternate Reality: The Dungeon.... Got to any guild in which you are an associate member, then just type "666" and check your coins, gems, etc. You'll find yourself suddenly quite rich. (A deal with the Devil, maybe? <G>)

In article <1995Nov13.172053.23003@wariat.UUCP>, Russ.Gilbert@apk.wariat.org (Russ Gilbert) writes:

The Atari joysticks were discontinued because they did not work very
well. As I recall, somebody did a project like this a while back with
limited success. Perhaps an IR adapter? IBM did a version of the PC-junior
keyboard like that...

```
: I saw an Atari 800 computer with disk drive and tape deck unit all in the
: box down at a local thrift store. Would anyone be interested in it for
: say $60?

That's way too much. You can get used 1040ST's with a built in 3
1/2 drive + mouse for $100 these days. Where do these stores get off?
It's like many of the people on the CoCo list are running them.

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, public domain software/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine; Atari Classics magazine, published by Jim Hood and Bob Woolley; and The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

3621. Re: DataSoft's Mercenary

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-16 00:00:00 UTC
From: smrgoodw@reading.ac.uk
Message-ID: <48f4ao$krn@susscsc1.rdg.ac.uk>
Source record: 87643

In article 0MCY200@sdcs.org, tom.smith@sdcs.org writes:
>Has anyone here done any exploring in the futuristic graphic
>adventure/flight simulator MERCENARY, by DataSoft? This was a very
>well done program that came out in the late 80's and was marketed as a
>joint Commodore/Atari format (Atari on side B). I would like
>to compare notes via E-mail on its mysteries...

I spent many hours exploring Mercenary and it's companion The Second
City. These originated from the UK programmer Paul Woakes who published
them under the name "Novagen" over here, I believe.

I also bought the Mercenary Survivor's (?right word) Pack which had
a lot of interesting information in. It's ages since I've played the
game, but I'd be willing to discuss it via e-mail. My address is
"J.F.Goodwin@reading.ac.uk".

I was sad to discover that the sequel to Mercenary, "Damocles" was not
released for the Atari 8-bit and there was a Mercenary III as well
something like "The *blurb* Conspiracy". However, The Second City
was like playing a different game and was a *whole* load more difficult.

- Jg

3622. Anyone need 800 & 810 for parts

3623. Re: 4 player games on atari 400/800?

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-16 00:00:00 UTC
From: rpinnega@spartan.ac.BrockU.CA
Message-ID: <1995Nov16.140839.13230@spartan.ac.BrockU.CA>
Source record: 87645
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit

```
: > Were there any games on the Atari 400 or 800 that used all 4 jostick ports?
: > Anybody got a list?

Super Breakout could handle up to 8 players -- since of course two
paddles fit into each joystick port.

Rob, Canada
```

3624. Re: Idea for making decent multitasking possible

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-16 00:00:00 UTC
From: Evan Samuel <esameul@iamerica.net>
Message-ID: <48endd$nst@ns3.iamerica.net>
Source record: 87646

Some time ago, I upgraded my Atari 800's 6502 cpu with a 65c816. This
is a full 16 bit cpu with 6502 instruction subset. It provide me with a
larger more flexiable instruction set. Memory addressing to 16Meg. This
upgrade is 99.5% compatible with all Atari programs. The remaining .5% was
software using the undocumented op codes in the 6502. The 65c816 powers up
in 6502 emulation mode, and can be switch via software to native mode (16 bit
data and 24 bit addressing). At the time I was attempting to expanded
the memory, increasing the clock speed, but I never completed that project.
I looked into the possiblity of using this cpu in the XL, and XE
computers. This would required a little more work because they use modified
6502c cpu's.
If you are interested in this modification, email me at
<esameul@iamerica.net>.

NOTE: If you want to multitask, the 65c816 would do a much better job with
minimun work.

3625. Re: Please help w/atari monitor!

Newsgroup: comp.sys.atari.8bit

I don't think you can use a sc1224 Atari monitor on anything but a ST.
The ST group might be able to tell you.

I am looking to purchase the follwing Atari items:

Cartridges:
Educational System Master Cartridge
Video Easel
Computer Chess
Mailing List
TeleLink II
RealSports Soccer
Microsoft Basic II (Cartride)
Star Trux
The Last Starfighter
Pengo
Atari Graphics (with Light Pen)
Skywriter
Track and Field
Battlezone
Foot Fight
Crystal Castles
Mario Brothers

Plus the following hardware
Atari 822 Printer
Atari 835 Modem

And the following prototype stuff:
Top cover for 1090.
1400XL
1200
1200XLS

If anyone out here can help me, please email me at strong@ee.utah.edu

>>>>
Yes, I have it installed in my 320K XE, haven't used it (the Mod)
in years. Someplace on my hard drive I should have the complete DOC's.
It made the OS think that the Cart had been changed or something
like that and forced a Cold Boot. The 'Freezer' they were talking about is
some program I've never seen nor heard of.

> I found an Atari SC1224 monitor at a thrift store really cheap and I
> picked it up. I thought it would work with my atari 800 (and possibly my
> C=64 or some other systems.) Anyway, I got it home and the pinouts were

Well, it is a nice monitor, at least the Japanese version is nice. The
problem is that it is an RGB split-sync device, where your Atari 800 and C=64
are composite. You could build or buy a NTSC comb decoder, but that would
be a lot of work/money. I would either sell the monitor, or use it with an
Atari ST, Amiga, or Apple IIGS/older Mac II. It would do a nice job.

If you still want the pinout, email me and I will send you one....

I think that the P:R: Connection WILL suport the modem control lines RTS/CTS on port R1. Note that port R2: does NOT support this feature. These lines basically tell the sender that the receiver can/can't accept any more characters. That feature is really all that is required for 9600 bps.

Now, the question remains as to whether or not the SOFTWARE pays attention to these handshaking signals. That's why hardware handshaking is so nice, it happens indpendent of the software. Nevertheless, the fact is that if the software supports RTS/CTS (software handshaking), then the higher speed modem should work.

Actually, the Jaguar and other game systems really don't have an OS. An Operating System is a collection of standard routines that control the hardware in a standard, hopefully device-independent manner. Fact is, the jaguar has many custom chips, and each have their own unique features, but there really isn't a layer of software that sits on top of them and controls the hardware for you.

You didle the bits yourself when you program for a game system. This is actually desirable because the overhead associated with any decent OS is usually enough to take its toll on overall system performance (and games need all of the performance they can get).

In short, even a system that has a BIOS may not have an Operating System. It would be the OS' responsibility to interact with the BIOS (and the BIOS itself is not an OS).

Mike,
I've had good luck repairing keyboards that don't work. Remove the key
cap by pulling it up. The 800 keyboards that I have seen had 2 metal
contacts that are pushed together when the key is pressed. These metal
strips are vertical. Just clean the strips with a little file or other
abrasive that won't leave any grit behind. You might have to bend the
strips also if the cleaning alone doesn't work. Good luck.

Well, so far I have managed to modify AMODEM72.BAS to transmit at 9600 baud. I can link to the PC with Win95's Hyperterminal. This allows me to transmit from the PC to the Atari, but not the other way around, or so it seems. I thought I would transfer a different comm program off the internet to the Atari and try to use it to go from the Atari to the PC.

I sent atzmod12.arc over to my atari (assuming this is a comm program, it may not be). I also sent SUPUNARC.COM from the PC to the Atari. SUPUNARC runs perfectly on PC Xformer, but when I try to run it on my actual Atari XEGS it gives me an error 136 (end of file?).

Can anyone figure out what I am saying? And if so, what am I doing wrong?

Extremely frustrated "Atarian born-again",

You can get Bobterm from the Atari Archive
(gopher://gopher.archive.merit.edu:7055/11/atari/8bit/Telecomm). It supports
speeds up to 19200, but your PRC might have a top speed of 9600. It can
also transmit files with Ymodem batch, and convert end-of-line codes while
up- or downloading. And, it's one of the few comm programs that can use
either the R1: or R2: port.

From the DOS menu (unless you're using Spartados), press "C", then
E:,FILENAME . Type the characters, then Return, then control-3.
If you don't want "Return" at the end of the file, you could use "K:"
instead of "E:", but you won't see what you're typing and you can't
backspace over a mistake (the backspaces would go into the file).

3647. APE 1.07 Emulates ALL COPY PROTECTION

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-18 00:00:00 UTC
From: dh395@cleveland.Freenet.Edu
Message-ID: <48lnhb$4c6@madeline.INS.CWRU.Edu>
Source record: 87519

Im currently putting the finishing touches on the newest APE enhancment,
total copy protection emulation. I have created a new .PRO image
format that is capable of storing and with APE, capable of emulating
even the most complex copy protected disks.

The following protected disks have been sucessfully converted to the new .PRO
format:

Alternate Reality: The City (Fully functional, including opening animations)
Koronis Rift (Lucasfilm)
Karateka (Broderbund)
Jumpman (??)
Apple Bandits
Archon (Electronic Arts)
7 Cities of Gold (Electronic Arts)
Ace Of Aces (??)
Fight Night (??)

All .PRO images were created with a PC->SIO cable that allows the PC to
talk to SIO peripherals. All images were created with a stock 1050
disk drive, and my new .PRO managment system.

Plans for the new PC->SIO cable will be included in the APE 1.07 documentation,
and will be posted here if there is a demand before 1.07 becomes available.

While i am confident at this point, based on the nature of the copy protection
in the above titles, that the new system will work on 90+% of existing
titles, I would like to try more games before releasing the new programs.

The new APE/PRO combination will work 100% on any image that contains
CRC/BAD sectors as protection. It also has worked 100% so far on disks
that contain 'phantom' sectors, such as EA, Lucasarts, etc.

But the catch is, these are the only original disks I own! :)

I need some kind souls out there who want to help APE become even better to
loan me your original software. I will use it to test APEs PRO capabilitys
only, and will return them all insured and in excellent condition.

If you like, I will also send back copies of the .PRO images for you to keep.

Thanks again to everyone who has helped me so far with the APE project! :)

Steve

The keyboard return key, you should be able to fix yourself lift off the key..We are speaking of the 0ld 800 computer. Inside you will see if I remember correctly, a plastic plug covering the hole which is square..this has to come out so get something and gently pull it out of the slot. Inside under this you will see 2 sets of copper strips that make the contact when the key is pressed. These need to be bent inward, be carefull and don't worry if all the little contacts don't make it only takes one.

Now you have the problem of putting the plastic and spring back together carefully put in the spring, then with a tooth pick or someting small open the contacts so you can slide the plastic cover back on, replace the key cap on top of that and you should be done..try it first..the tooth pick will hold open the return contacts while you test it..then shut it off..and replace all the above..

As to the 810 disk drive, have several, in working order, is $15.00 shipped with power supply too much?

Bob

3656. SDX 4.22 Update...

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-19 00:00:00 UTC
From: F Tooned <ftooned@delphi.com>
Message-ID: <xpPlqx6.ftooned@delphi.com>
Source record: 87528

Hi Everyone,

I just wanted to provide a "little" more information concerning
the new FTe SpartaDOS X 4.22 upgrade. This pertains to creating
a large "custom" partition for use with SpartaDOS under SIO2PC
that may also be used with PC Xformer.

If you have created an SIO2PC partition that is larger than a standard
floppy partition with SDX versions prior to 4.22, you will find that
they just don't boot using PC Xformer. This is due to the fact that
PC Xformer (at least prior to 3.01), does not boot with SpartaDOS from
a Double Density disk. If Derek has corrected this is later versions,
I'm simply not aware of it.

With SDX 4.22 a Hard Drive partition may be formatted in Single Density,
if it is selected from the Menu. I should mention that large partitions
are not actually "formatted", you only need to create them and then
(B)uild a Directory with them. (Using the SDX formatter). If you want
to use the same disk image under SIO2PC and PC Xformer, you just need
to specify "Single Density" before building the directory. Double
Density partitions may also be created for use under SIO2PC, or if
you don't need to "Boot" from them with PC Xformer.

IMPORTANT!! SIO2PC has four slots available for disk images. I will
refer to them from the perspective of TOP to BOTTOM, because the drive
ID's are reconfigurable. The only "Drive Slot" that will support
the drive configuration data with SpartaDOS is the TOP one. If you
create a new image with SIO2PC, and then wish to format it with SDX,
then please make sure it is located on TOP. After a directory has
been created, this disk image may be used on any of the other slots.

If you've created a Single Density disk image, this may also be used
with PC Xformer. The largest single desity partition that may be
created is 8mb (when 65535 sectors are used).

If you are not using SDX 4.22, then single density partitions may not
be created. I will be uploading an IBM "zipped" disk image for all
of you PC Xformer users out there that can't create their own. This
image will also contain SpartaDOS version X32z.DOS and X33a.DOS, that
will also work properly with PC Xformer.

Well, I hope this helps! I've been using these images almost religously
now for the past 4-5 months, and have found them extremely reliable as
long as your SIO2PC -> Atari link is solid...

3659. SIO2PC problem

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-20 00:00:00 UTC
From: <>
Message-ID: <48q299$adk@newsource.ihug.co.nz>
Source record: 87531

Hi,

I have the following problem with SIO2PC (3.19):
Reading is perfect but writing (to the PC) pauses quite often.
It then takes a couple of seconds before it continues. When I
use some diskcopy program (like Disk Doctor II) the is no
problem at all. Only DOS (Mydos, DOS 2.5) seems to have
some problem here.

Any advice or suggestions?

Thanks,
Stefan

>it be possible to have a quick list of them?

The commercial programs available written in QUICK are:

- RubberBall
- MineSweeper
- Glaggs IT!
- Bombi
- Logistic

All 5 are games. But there are also some utilities written in QUICK, but
they are published on the QUICK support disks, not as standalone
packages:

- DiskEditor
- VideoTitler
- A graphics program
- Printing programs
- and many other things dealing with graphcis and sound, esp.

These are only the programs I dealt with somehow. Probably there are many
more - I can't know all of them...

>CTS/RTS is a form of hardware handshaking. XON/XOFF is software handshaking.

Indeed, this is correct. XON/XOFF handshaking can be accomplished via 3-wire
RS-232 because it is based on stop/start characters being used for flow control,
whereas CTS/RTS requires a 5-wire RS-232 line to accommodate the extra signals.

What I SHOULD have said was that CTS/RTS signals do you no good if the software
doesn't pay any attention to them, so the software must correctly identify the
handshaking scheme (whether it be XON/XOFF or CTS/RTS).

Sorry I caused any confusion.

3664. Re: Truly original games

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-20 00:00:00 UTC
From: winston@merk.com
Message-ID: <DIC2Jq.KoI@merk.com>
Source record: 87536

Truly original games ? Well, a lot of them appeared in the computer magazines of the early 1980s. Hmm... let me think....

There was SPACEWAR! and PONG, which were two player contests. These were also simulations (PONG simulates tennis). These were also third person, overhead views.

There was "monster in the maze" or "minotaur in the maze" which developed into Pac-man.

There was "little red bug", "rally", "slalom", which became Pole Position and River Raid.

There was "minefield", "robots", "daleks", which became Robotron 2084 and Bezerk.

There was Kingdom and its variants, which started on a WANG calculator and has always remained Kingdom.

There is Lunar Lander or Lem.

There is Crowthers and Woods ADVENTURE! and its variants.

There is Berkeley STAR TREK (a.k.a. Matrix SpaceWar) and its variants.

There is Berkeley Rogue.

There is Space Invaders.

There is Flight Simulator.

Hmm... I notice a bit of a pattern. The player is piloting a craft or travelling on a course in one class of games -- Lem, River Raid, Flight Simulator, Jungle Hunt, Pac-man. The player is in a contest with another player or the computer in another class of game -- PONG, Mortal Combat, Space Invaders, Robotron, Joust, Shoot Out. The player is just exploring the game world in a third type of game -- Adventure!, Rogue, Myst. Of course, there are more game types that don't fit into these three types.

What is Conway's Life, for example. Is it a contest to win? Is there a course to be run?

Then there are "casino games" like dice and blackjack. Those are "simulations". The electronic money is not really money. It is actually your "score". Hmm... I guess in the Las Vegas sense of the word, you do make a "score".

Then there are other "card" games that you don't win, such as "Tarot Card Reader" or "I Ching Reader". Are these "games" ? A "fortune teller"

program --IS-- a program used "for fun" that is a simulation of a human activity. This does seem to classify such programs as "games".

There are also strategy games such as Chess, or Kallah, or Nim.

There are wargames such as Eastern Front and Computer Ambush and Squad Leader and Empire.

What about computer versions of Traveller, such as Creative Computing's "Star Merchant", or BBSes' "Trade Wars", or "Galactic Trader" ? Are such games "original" ? What about "Air Traffic Controller" or "Kennedy Approach" ?

Hmm, there is a lot to think about.

3665. Re: Truly original games

A simple definition, one that's completely full of holes, is "a game is not original when the majority of it's gameplay elements are the same as those in a single previously released game." Arkanoid is not original, because the moving paddle, bouncing ball, general screen layout, and overall goal are the same. Warlords has the moving paddle and bouncing ball, but I'm more tempted to call it original.

I'd love to see the list, though.

(J. Harris talks about the absence of an OS on the Jaguar.)
Off topic I guess. But I'm interested in computer
archetecture and 'low level' stuff, going a bit beyond
BASIC.
Mr. Harris mentioned that things can be done when you can
grab the machine by the balls (gonads, non-sexist) and not
have an OS in the way. An OS placing certain limitations on
the capabilities, particularly graphics capabilities. He
mentions 'GED' as an example of what can be done on A8.
My problem with this is that GED IS done on a machine with
an OS. The A8 OS can be replaced with another in RAM, or
custom OS in ROM, or the A8 OS can be totally ignored and
the RAM used for something else. Comes to mind DTACK
grounded 'DBASIC' for the ST. The author only used the
character set from the TOS ROM, the OS he did himself.
I would think that advanced concepts could be done, as on
the A8, even if an OS were present. Why is it I suspect
Atari just didn't wait for an OS and brought the machine
out before a 'completed' one was made. I'm sure the Jaguar
had to be tested with some simblance of an OS. And it
occurs to me that if someone does the basic io routines for
a particular application that that person or group would
probably use those basic io routines for future projects.
It seems sort of like developing a bunch of macros for the
6502 and using them regularly in many projects.
I know there's a question in there someplace.
It seems that the Jaguar puts software producers in the
position of system developer. I would think many, or most,
developers would like not to have to do this sort of low
level thing, J. Harris and that guy from DTACK grounded
being the exceptions.

Russ.Gilbert@apk.wariat.org (Russ Gilbert) wrote:

>My problem with this is that GED IS done on a machine with
>an OS.

The point I was trying to make, had to do with machines that have OS access _ONLY_. I know 3DO is like this, and I have been told that Sony Playstation is this way as well. This restriction limits the maximum potential of what the machine would otherwise be capable of doing. I agree that having some OS functionality in addition to direct hardware access is the best design, and I'll continue that thought later on.

The Atari8 was well designed to allow both, but the company itself was still clueless. Remember that they kept the details of the custom chips secret for well over a year. Imagine what the software would have been like if Atari made direct access completely forbidden. (Some imagination required here, since the OS would have needed support for PMGs and other functions). Typically, this would be done if the company wanted the ability to improve the chips later on, and did not want to be tied down to the same hardware organization. Programs that banged the hardware directly would risk failure if the hardware was changed later.

Anyway, the state of 3rd party Atari8 software in 1980 was quite dismal. 4 colors at most, with no PMGs. Let's say Atari had provided OS-only support for graphics at a pretty comprehensive level. And since I'm just debating the merits of different design philosophies, continue that scenario by assuming that programmers did not break the rules and find out how to access the hardware anyway. In this scenario, the early programs would then have looked _much_ nicer, because everyone could have utilized more of the advanced features of the machine, and it would have been easier to do so. However, the most advanced stuff would never have happened at all. This is the condition that I feel currently applies to the Sony Playstation. If the Jaguar survives the next several years, I expect its best games will eventually surpase those of the Playstation, even though the hardware is not quite as fast. I believe that I could already match the quality of Ridge Racer.

>Why is it I suspect
>Atari just didn't wait for an OS and brought the machine
>out before a 'completed' one was made. I'm sure the Jaguar
>had to be tested with some simblance of an OS.

Atari did provide source code for many functions, including 3D graphics, sound, reading controllers, etc. It was treated like library code, where you could link it into your own program, and then call the ready made routines. This theoretically offers almost the same benefits as an OS,

with the added advantage that these routines can be continually updated after the machine has shipped, since they aren't built into the console itself. I personally think this is an excellent design, however the routines that Atari supplied were completely inadequate for the job. If you've seen Club Drive, you've seen an example of the code that Atari provided to developers. The concept was good, but the implementation was very poor, effectively leaving the Jag as a machine with no OS support.

>I would think many, or most, developers would like not to have to do
>this sort of low level thing.

This is probably true. Along with writing code in C, there seems to be an overall mentality of getting the job done quicker and more profitably, rather than the outdated method of making it the best it can be. There also continues to be an elite group of programmers who still believe in the old ways, and I tend to prefer the products produced from people like this.

In closing, I hope that it would be accurate to say that most developers would like to have the ability to do low level access if they needed/wanted to. Sadly, a lot of them probably really don't care.

Hi!

I have about 45 Antic's and Analogs from the mid-80's that I'd like to pass on to someone who will take good care of them. ;)

I had previously posted about them several months ago, and the person who decided to pick them up kinda delayed for two months, and is still interested if I wait another month (etc)...but I really would just like to get rid of them before I just chuck them into the trash.

If you live around Atlanta, you can easily pick them up.

If you don't, the local Mailboxes Etc says that shipping will be around $25.

Thanks!

>Truly original games ? Well, a lot of them appeared in the computer
>magazines of the early 1980s. Hmm... let me think....

I think that a game can still be original without being at the head of the lineage of a particular play mechanic. It's like the old "there are only 7 story plots" theory. How boring to claim that only a handful of games are original.

I think Drelbs is original, even though it is a maze game at heart. Rainbow Walker too, though it obviously owes a conceptual debt to Q*Bert. That's different from other games that took Q*Bert and changed the graphics, like Pogo Joe and Pharoah's Pyramid. There is a glaring difference between knock-offs and attempts at original thinking, IMO.

James Hague

| | |
| | | LEFTY's Atari 400/800 Cartridge Auction
\_/ | \_/ ****************************************
#
#
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
LOOK FOR OTHER GREAT FUTURE AUCTIONS by LEFTY
------------------------------------------------------------------------------
AUCTION # 1: *Atari-400/800/600XL/800XL/130XE Cartridge Auction
AUCTION # 2: Atari 5200/7800 Cartridge Auction
AUCTION # 3: Atari 800/5200/800 Systems Auction
AUCTION # 4: Atari 2600 Cart Auction/Part 1 (Aprox 100 carts)
AUCTION # 5: Atari 2600 Cart Auction/Part 2 (Aprox 100 carts)
AUCTION # 6: Atari 2600 Cart Auction/Part 3 (Aprox 100 carts)
NOTE: These 3/2600 auctions each contain their own
unique variety of cartridges. The first
and second auctions contain common and
uncommon cartridges, while the third
auction contains mostly rare cartridges.
AUCTION # 7: Atari 2600 Special Systems Auction
AUCTION # 8: Atari 800, Atari ST, C64, and IBM disk software
AUCTION # 9: C64/ODY/TI99/TRS80/VIC20 Cartridge Auction
AUCTION #10: C64/ODY/TI99/TRS80/VIC20 Systems Auction
AUCTION #11: Misc Leftover Auction (A little bit of everything, and more)
#
NOTE: Most of the future auctions listed above will start in '96. The
exact date of each auction will depend on how much time I have
and how long it takes me to gather data for that auction.
#
@ = Auction is Finished --- * = Auction in progress
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
#
WHY ALL THE AUCTIONS:
---------------------
It's time for me to clean house. I am selling just about everything I
own pertaining to old game and computer systems, cartridges, software,
and other items for which I am hard pressed to find any more storage
for. I have far too many items to sell in one Auction. Therefore, I
```

have broken it up into several Auctions (11 in all, so far) as I've
shown above. The last Auction will have basically everything that I
couldn't catagorize that are leftover. I hope these Auctions will
help you in your collecting endeavors. Have fun!
#
#
TRADES OR BULK SALES:

I am NOT really interested in any TRADES or BULK SALES, unless they
are very beneficial to me, since my objective for these Auctions is
to get extra cash. However, I will entertain any trade deal that you
wish to come up with, but be warned, it will have to be a very
attractive deal for me to accept it. I will, of course, notify the
current bidder affected by any deals that I might make, and allow
the bidder(s) a chance to make a comparable offer. However, as I
said, the chance of an offer being accepted is very small.
#
#
PLEASE READ THE FOLLOWING AUCTION RULES:

I have added the following rules and comments both for your protection
and mine. Please read through them carefully as this will save us all
some time in the long run. These rules should remain stable through
any of my future auctions, also. If a rule is revised, I will flag
it with a double asterisk (**) in the first two columns of the first
line, for that auction only.
#
**************************** START OF RULES ****************************
#
o This auction starts on Saturday, November 18th at 8:00pm and
ends on Monday, December 4, 1995 at 8:00pm.
#
o All cartridges and/or items that have NOT been BID on WITHIN
24-HOURS of the deadline, will be CLOSED and all the winners
will be notified by email.
#
o All cartridges and/or items that HAVE had a BID placed on them
WITHIN 24-HOURS of the deadline, will REMAIN OPEN and the
Auction will continue using the 24-hour rule. This rule simply
means that if the cartridge and/or item being bid on does not
have another bid on it within 24-hours, then that item is closed
and the winner is notified by email. Otherwise, the cartridge
and/or item remains open for another 24-hours. This continues
until all cartridges and/or items are closed.
#
o Minimum bid settings are shown in BID column until a BID NAME other
than "NOBIDDER" is shown in the Bidder column (last column). I
will not accept any bids that do not meet the minimum bid listed.
#
o Minimum bid increments are as follows:

$0.25 - $0.99 = $0.25 Increment
$1.00 - $9.99 = $1.00 Increment
$10.00 and up = $2.00 Increment
#
o First time bidders are required to give their full name and address
of where they want their cartridges and/or items shipped to.
Remember, this only applies to the first time (per auction) that
you place a bid in that auction. I will verify all addresses with
each winner before shipping out any cartridges and/or items.
#
o First time bidders will need to also send me an alias name of up to
8-characters. This name will be used for any bids that you will be
sending in during the course of this auction. This may be your real
name or a made-up one, depending on if you wish to remain anonymous
or not. If I do not receive one, I will make one up starting with
"Bidder00" and incrementing through to "Bidder99".
#
o If you BID, you are expected to BUY!!! Of course, I cannot enforce
this, so to be fair, I will allow up to three (3) cancellations
by the same bidder during the course of all my upcoming auctions
shown above (prior to the rules), and provided they are cancelled
within 24-hours of the original bid. If you cancel for a fourth
time or if you cancel after 24-hours anytime, you will be barred
from bidding in any future auctions that come up. In other words,
3-STRIKES AND YOUR OUT!!!
#
NOTE: If someone cancels a bid, that bid will be removed and the
previous bidders bid and bidder name will be entered in
lieu of, and email will be sent notifying that bidder of
the change.
#
o New updates will be received by all bidders every 24-48 hours
(I will try to keep it within 24-hours as much as I can). I
will also try to keep an updated posting in the following
usenet area - "rec.games.video.classics" and "comp.sys.atari.8bit",
whenever possible.
#
o Shipping cost will depend on the how many cartridges you buy:
1 Cartridge = $2.00 Total
2-6 Cartridges = $0.50 per Cartridge extra ($2.50 to $4.50)
7-15 Cartridges = $5.00 Total
16-49 Cartridges = $7.00 Total
50 & UP Cartridges = $9.00 Total
#
NON-Cart Item (10lbs & under) = $7.00
NON-Cart Item (over 10lbs) = Shipping Wgt x .40 (Aproximately)
(This will be more accurately defined once everything is closed
and a weight and destination can be determined)
#
NOTE: All shipping will be done US Parcel post or UPS, depending

on your choice. Please let me know ahead of time if you
have a preference. Otherwise, I will ship US Parcel Post
for all cartridges and/or items totalling $5.00 or less
in shipping and UPS if the total shipping is over $5.00.
#
o I will accept payment either by check or money order only. If by
check, I will wait 5-7 days for it to clear before mailing any of
the cartridges and/or items. If by money order, the cartridges
and/or items will be mailed within 24-48 hours of having received it.
#
o All cartridges are sold as is. Most have been previously tested,
but not all (mainly because I believe that most cartridges will
work). However, I will test each cartridge on my system before
shipping it out. This way, when you receive your cartridges and/or
items, you know they are working properly. If I have a problem
with a cartridge, I will notify you and you will be compensated
to suit.
#
o Whenever an asterisk is shown to the left of the cartridge name,
it means that the instructions for that cartridge is available,
and will be included in whatever bid you make.
#
o I reserve the right to pull or refuse to sell any cartridge from
this auction for the following reasons only:
1 - The Cartridge and/or item has not met its minimum bid
settings and has not been bid on by the halfway point.
2 - There is an offer on the side for a cartridge and/or item,
that is acceptable to me.
#
o The information listed with each cartridge is to my knowledge,
accurate. However, I am not responsible for any mistakes and/or
errors that I may have overlooked. If I find any mistake on
any of the cartridge information, I will send the correction
along in the next update to all bidders.
#
****************************** END OF RULES ******************************
#
#
Cartridge Maker Codes (These may be revised depending on the auction):
AT = Atari AV = Activision BB = Broderbund
BF = Big Five EP = Epyx IM = Imagic
LT = Lightning MW = Midway PB = Parker Bro's
RK = Rokian SI = Sierra SY = Synapse
TE = Thorne Emi
#
Cartridge Types (These may be revised depending on the auction):
TL = Text Label only.
PL = Picture Label.
#
Cartridge Conditions:

VG = Label has heavy signs of wear and tear. There may be tears,
peeling offs, and/or scratches. The label is mostly
readable, but some parts of it may not be.
F = Label is completely readable. May show some signs of minor
wear and tear, such as scratches. Screw holes may also be
evident (see Comments).
VF = Label has very slight wear and tear. There may be some very
slight discolorings. The label is clear and should not have
any major defects marring the readability it. However, there
may be an End Label Missing, Screw Hole(s), etc which should
not affect its readability and clarity.
NM = Near perfect label. May show very slight wear. No defects.
M = This is a new cartridge and label or is just like new.
#
Defect Codes (These may be revised depending on the auction):
LP = Label Peeling.
LW = Label is Wrinkled.
SSL = Small Scratch(es) on Label.
#
Comment Codes (These may be revised depending on the auction):
XE = 130XE compatible system cartridge
OEC = Open End Cartridge (Mostly Non-Atari)
ITMS = includes Temparature Module, sensor, etc (COMPLETE)
ILSAS = Includes Light sensor, assembly, stand, etc (COMPLETE)
J### or R ## # = Number Stenciled on Cartridges (Atari only)
(I don't know what this number represents.)
#
Duplicate Cartridge Comments:
o All duplicate cartridge names listed have been added because
they have subtle differences among them. Examples of some of
the differences found would be:
1 - Numbers stenciled on cartridge.
2 - Color of cartridges (Not the label).
3 - Country where cartridge came from (Mostly MN carts).
4 - Picture vs Text Label.
5 - Year cartridge was released.
6 - Maker of cartridge.
#
When a duplicate cartridge is listed, I have listed each
cartridge separately along with its maker in alphabetical order.
#
#

3683. SIO cables, where to get?

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-22 00:00:00 UTC
From: daniello@austin.ibm.com
Message-ID: <48vcht$v4o@ausnews.austin.ibm.com>
Source record: 87406

I've picked up a few Atari computers and disk drives lately
at thrift stores and flea markets, but none of them ever
appear to have the SIO cables. Does anyone have extras
or know a dealer that still has a few?

But the PCjr keyboard always used the IR interface. The thing that really bugged customers was the dorky "chicklet" keys on the keyboard. About a year into PCjr production IBM ugraded all owners to full-stroke keyboards for free. These were much easier to type on and still used the IR interface.

But lets face it, the Atrai 8-bit still ran circles around the PCjr in overall performance.

In general, what types of real-time video compression algorithms are
available for my Atari 800? Are these going to be the H.261 DCT-based
codecs (following the venerable CCITT H.320 videoconferencing
standard) or newer wavelet-based compression techniques?

It is interesting that they seek 6502 assembly or Atari BASIC
programmers for web servers..

>

These are Double Density PERCOM drives with the switches to force Single
Density but, like my INDUS GT's, I leave them set in the DD position. The second unit
I have and it's Slave are both Double Density, Single Sided drives. Mine I received with
no drives in it. I have installed 2 - 3.5" 720K drives and they 'seem' to format, BUT, when
you write to them, they start failing, Time Outs (No Device Connected) when the Disk is
half writen (360K). This suggests that the controler can not really handle Double Sided
operations. Yes, I can 'talk' to both of them, but it appears like the controler can only
handle Single Sided drives. I can Force them to take more data if I only copy 1 file at a
time but even then, sometimes I get the error. I suspect this data is going to the same
side
already written. The DOS Directory is just being filled in as if it were Double Sided, the
way that it was FORMATed.
Question: What is the EPROM Ver #? Mine is marked as "V 1.20"

(SNIP)

> These drives work fine w/ SpartaDos as well (no ultraspeed).

Yes, I'm using SDX, 80 tracks, Double Sided, Double Density, Standard
Skew (No High Speed Mode).

>

I haven't seen these either. I suspect a different UCode for the Double Sided
Controlers.

Yes, but it wasn't exactly the same... Having both in the ol'
collection, I must say that I always thought Last Starfighter was much
more fun than Star Raiders II, but I don't exactly remember why. :)

```
> I'll buy some if they are in JPEG. GIF is shit for data compression and wastes
> a lot of space.

GIF is very good for data compression. JPEG is "tighter" as it uses
Lossy compression. You could say "gee, this water seems lighter if I
carry it in a bucket with holes in the bottom", but you are still losing
some of your water. The GIF standard, while a bit old, uses
noiseless/lossless techniques similar to ZIP, gz, or ARC programs. JPEG,
on the other hand, uses sort of an "approximation" method. It works
pretty well, but you are still left with less picture.

BTW, what are these jerks doing cross-posting their porno ads here anyway?
I should post a bunch of ads for pictures of naked disk drives in their
newsgroups and see how they like it...

Some do, some don't. For instance GORF does not. There were a few
early cartridges that made some "illegal" uses of the old 800 OS.
When the new XL machines came out they would not run. I would suspect
that this is also true of the XE. If you can find a disk based
version however, you can run them using Atari Translator.

Hope I'm right here, I'm a little rusty...

Wasn't that the original name of what became "Star Raiders]["? I
could be wrong, but it seems to me I had a two copies of the same game
with these two different names. Is that the one where you travel
around the solar system going from planet to planet to wipe out
invaders?

3696. 600XL questions

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-22 00:00:00 UTC
From: cliffl@mail.netshop.net
Message-ID: <48um5v$sna@news.netshop.net>
Source record: 87419

I just tried to boot up my old 64k 600XL again. It seems to have a
few problems that someone may be able to help me with. First of all
it won't boot into BASIC. If I don't boot into DOS I end up at the
self test. There is no way to get it to go to BASIC. I don't think
this is a big problem mind you, since I think I have a copy of Rev.C
BASIC on disk somewhere.
Secondly, when I run the memory self-test I only get 40 small squares.
Seems to me that I should be getting 64 of them on a 64k machine. Am
I remembering this right? If I am, I suppose I'm on my own since it
is probably a problem with the memory upgrade card.
Thirdly, the signal going to the TV is really crappy. Is there a way
to tune it a little better?

Again, any help would be appreciated,

Cliff Lawley

Cliff,

Yes that's the game. David just has a bootleg copy that someone smuggled out of the deveolper's before it was finished (sure played well though). I obtained a copy as well when I bought a friends 8 bit system. David, hang on to it. There are a lot of copies floating around, but, maybe one day it'll be a collectors item!

Sincerely,
- Byron Followell

: I have 2 - RFD-40S1 and 1 - RFDS1 (slave). The Slave and 1 of
: the masters belong to someone else. 1 of the masters was given to me, with
: no drives; I checked it and it is good. The other person's I found had a bad
: 1795 controler, waiting on it from Best Electronics.
: Anyway, I am a technician and I've been looking them over very
: close. The first thing I did was to make a copy of the highest Revision UCode
: and install it in the other unit. Used 2732's as I don't have any 2716's, had to
: pull a jumper and ground pun 20 to make it work. What I need to know is (#1)
: what is the lastest known UCode Revision? (Lastest Version I have is 1.20)
: (#2) What does it take to convert the RFD-40S1 to RFD-44SS1's?

Rich,

I have a working RFD40-S1 that I sucessfully converted to DS/DD using
a standard 720k Teac mechanism. If you need any information as to the
internals of the unit, or how exactly I did it please e-mail me. I also
have a single density unit here that as I recall is totally diffrent
inside. I upgraded it to 360k using the same 720k mech (single density).

Here is an article I wrote a long while back on how I converted my
RFD40-S1 to 720k:

Article 48 of freenet.sci.comp.atari.prog.8bit.resource:

>said something about getting a y-connector to handle 2 drives.
>Wouldn't that put a strain on that little power supply inside?
>Just wonderin'. Well, I stop blabbing now. Thanks for any help
>you can give me.

You have the Single Density version of the Percom drive. But ALL percom drives support DOUBLE SIDED 80 TRACK OPERATION. You can still hook up and 3.5" drive but you will only get 360k instead of 720k. All Double Density models are serial numbered RFDXX-sY where XX is the number of tracks on the mech ORIGINALLY installs, and Y is the number of SIDES on the mech originally installed.

My percom w/ 720k mechs is labeled RFD40-S1. It originally contained a FULL HEIGHT single sided 40 track drive. A real beast to remove.

The Tandon Mech inside MAY be a single sided 40 track mech, which was top of the line at the time it was made, but the controller will support 80 tracks DS.

The 'EDGE CONNECTOR' sticking out the back is a pass through connector to hook up more floppies. To convert your drive to 3.5" mech do the following:

1: open the drive and REMOVE THE 5.25 mech and toss it in the trash ;)

2: REMOVE THE EDGE CONNECTOR BOARD and the cable that connects it to the main controller board, there may also be a single ground wire running from the card to the controller/power supply. Cut this ground wire and remove the edge connector board. You can discard the edge connector board, you will never need it again.

3: Buy some 720k drives. Dont bother with 1.44Meg drives, they will just be a waste of cash since you will only get 720k. The Percom does not support the higher transfer rate used in 1.44m mode. (Since it didnt exist when the controller was made ;)

4: This is the tricky part. You will notice the drive connector on the main board is the exact same type as on a regular IBM floppy drive board!

If you just want 1 360k drive just go get a regular PC internal floppy drive cable for $1 and plug one end into the board and I end into the 720k drive. If the cable you get has connectors for 2 floppies on it and a twist in the wire near the middle, DO NOT USE THE PORTION OF THE CABLE THAT IS TWISTED, USE ONLY THE 2 CONNECTORS BEFORE THE TWIST.

If you want more than 1 3.5" drive, get a STRAIGHT THROUGH cable that has no twist and more connectors. The Percom Controller wont work correctly

with PC type cables that contain the twisted wire pair.

You can build your own pass-through cable from parts from Radio shack if need be, just get regular 34pin connectors and a ribbon cable.

5: Power supply considerations. The 3.5" mech will need an adapter to draw power from the large 4 pin connector on the Percom power supply, this is a STANDARD PC POWER ADAPTER and should come with your drive. If it does not it costs $2 at radio shack.

If you want to power more than 1 drive get a standard PC POWER SUPPLY Y-splitter. The power drain of 2 3.5" drives in my Percom is roughly only 2/3 of the draw of the single old FH drive. No need to worry about toasting the power supply. If you want more then 3 drives hooked upto the unit (it will support 4-8, depending on the 3.5" drive types) I would suggest you invest in a cheap PC power supply.

6: Drive selection. Drive number selectionis handeled from the drive unit exclusivly on SD units, set the jumper on the 3.5" drive to D0 or 'Drive A' or whatever is FIRST.

7: Once you get the drive powered and connected, its time to give it a test. Turn on the drive, carefull not to let anything metallic come in contact with the main board.

If all is correct you will hear the drive motor spin for about 2 seconds and the BUSY light on the front will flicker for 2-3 seconds and then go dark.

If you oriented one of the cable ends backwards (easy to do w/ a homebrew cable) the drive light will be lit forever when you turn on the drive and WILL NOT GO OFF. The motor may also spin forever. This will NOT harm the drive or controller, just reverse one end of one of the cables and try again.

Hook the drive to a computer and power on the drive, after the light goes off turn on the computer. If you hooked up the power supply, drive cables and drive selector CORRECTLY the drive BUSY light should come on as the Atari tries to boot from it as normal.

Turn both units off.

8: You now have a perfectly good 360k drive! ;) Just get MyDos loaded, hook up the drive and use the configure option to set the drive controller to 2 sides, 80 tracks, SINGLE DENSITY. the seek time should be set to the fastest possible (0 if I recall).

Its been awhile, but I think the options go: High Capacity: NO
Configurable: YES
Double Sided: Yes
Tracks: 80
Seek: (fastest)

9: Format a disk at this density, it takes quite awhile. Write DOS/DUP and
you now have a bootable 360/720k disk!!!! These drives are real
speed demons in SD too, you will love that!

These drives work fine w/ SpartaDos as well (no ultraspeed).

The only modification to the above directions for DD drives is that the RDF
drives have dip switch settings to control the 'drive offset'. You can adjust
these so that physical drive 1 is atari drive 5, etc. these switches are
not present on any of the SD drives I have owned.

In reply to Russ Gilbert's previous post:

You are correct in assuming that a Jaguar programmer will accumulate many basic IO routines over time. However, just including these into the software (as you alluded to using 8-bit macros) does not constitute have an OS. There still is no layer of software sitting between your application and the hardware; if you are including some IO routines into your software, you are controlling the hardware directly (and probably not through a driver).

This OS-less approach can actually be desirable, though. If the application is in total control of the hardware, it has the freedom to use only the IO libraries it NEEDS, whereas a machine that has an OS can get bogged down by code that isn't even being used. Atari would be wise to actively develop powerful libraries that can then be distributed to its developers for use -- this would offer many of the advantages of having a true OS.

I think the only 8-bit Atari computer that _couldn't_ run 400/800 cartridges (in some cases) was the Atari 1200XL. And that wasn't because it was incompatible... it was because the cartridge slot was smaller than the 400/800 cartridge slots, and the plastic casings of some non-Atari cartridges physically couldn't fit into it.

Could be wrong.

>Can some one tell me how to control the joystick ports in Atari
>Basic. I need to control a reply off of them.

>David

The joystick ports are read using STICK(n), where n is the joystick you want
to read. n can be 0, 1,2,3. On an XL/XE you would normally only use n=0 or 1.
The expression to read them is:

X=STICK(0)

X will now contain the value for the direction the joystick is pointing.

```
14
10 | 6
\ /
11 --- 15 ---- 7
/ \
9 | 5
13
```

The joystick button is read with STRIG(n) where n is 0,1,2,3 corresponding to
the same as the STICK(n) you are reading.

It would be read with the expression:

B=STRIG(0)

If B=0 then the button is pressed. If B=1 then it is not.

You of course do not have to use X or B, any legal variable name will do.

The paddle controllers are read much the same way, except there are twice as
many paddles as joysticks.

X=PADDLE(n)

n is 0,1,2,3,4,5,6,7,8

X will be a number from 0 to 255 relating to the position of the knob.

The button is read:

```
B=PTRIG(n)
```

Hope this helps.

Can't help on the not booting into Basic. Do you mean that even booting without any drives attatched doesn't take you to Basic? If not, it's strange because of the answer to question 2....

No, you should not expect 64 squares. The self-test only tests RAM up to the Ramtop (or is it memtop?) value, that is, the free RAM below the operating system ROM space and the cartridge (Basic) space. That would be 48k for a boot with Basic disabled, or 40k for a boot with Basic enabled. That's why it's strange to get 40 squares, but not have Basic up. To see if you can get the full 48k, boot without drives with OPTION held down. You should get directly to Self Test and get 48 squares.

As to the TV signal, the most common problems are a bad video cable and/or a bad switchbox. Check or swap those out before getting into the hardware. There is a small hole on the bottom of the machine with a slotted small-screwdriver accessable pot adjustment for adjusting video. It is a VERY touchy control, however, and you'll probably be sorry you started fooling with it, especially if it turns out to be the simpler items.

I found an old ST mouse. and was testing it on my 130XE with a program called GOE demo. It works pretty well. Anyone know of any other programs that support this type of setup? The joystick inputs values into the stick(0) and paddle(0,1). Any ideas? Thanks.

Also, anyone who knows anything about XEP80, I have a few questions about this particular piece of hardware. It's been about 8 years since I've even booted up an 8bit Atari, and I've almost completely lost touch with the community. Any help would be greatly appreciated.

Sounds like a bad BASIC rom, but you should still be able to insert a BASIC
cart, which would be a whole lot better than trying to use a disk file.

>Secondly, when I run the memory self-test I only get 40 small squares.
>Seems to me that I should be getting 64 of them on a 64k machine. Am
>I remembering this right? If I am, I suppose I'm on my own since it
>is probably a problem with the memory upgrade card.

Unless I'm mistaken, 40 squares is right if you have BASIC, but no DOS and
type either DOS or BYE, or if you have DOS loaded just BYE. If you have no
BASIC (holding down OPTION when you turn it on), then you should get 48
squares. The extra 16K is not tested.

>Thirdly, the signal going to the TV is
really crappy. Is there a way>to tune it a little better?

It could just be a bad video cable. Try replacing it. Also, try changing the
channel on both the TV and the Atari. If you have a local station on the same
channel, it can interfere. As a last resort, try a thrift store or flea market
to pick up an 800 XL. They are pretty common for usually less than
$10.00

The adjustment on the bottom is only to adjust the hue setting. If you want to
adjust it, you need the SALT cart or file. There is no way I know of to adjust
it properly without it.

"ATZMOD12.ARC" is a ZMODEM "file send" program, like FTP, and not a full terminal program. Your error sounds like an "extra padding" error that comes when XMODEM checksum has to "pad out" a block to a full 128 characters before sending it. It sounds like you need a padding stripper program such as "STRIP.COM" or "DLDOCTOR". If you have TEXTPRO, you should be able to strip off the trailing bytes by hand.

3718. Rare 5200, Vic 20, Mini Arcade Auction

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-23 00:00:00 UTC
From: Dshaw@cris.com
Message-ID: <49141f$5c7@spectator.cris.com>
Source record: 87440

Included are some Atari 400 units that are for sale, and there are multiple units, so they are not included in the auction. Please see below for details.

Below the rules are a few choice collector items, so enjoy and good luck bidding!

Thanks,
David Shaw
Dshaw@cris.com

RULES AND LEGAL MUMBO JUMBO: (My thanks who all who developed these rules... it sure helps when you forget something!)

*) You MUST include your name, email address, mail address, and phone number with your initial bid (I apologize if it seems I'm being anal, but with people not holding their commitments as winners really hurts us all!).

1) The Initial Posting for this auction was made on Wednesday, Nov 22 on or before 3:00 am EST. The official deadline for bidding on all items is 11:59 P.M. EST, on Wednesday, Nov 29, 1995. The auction will continue until that time, or until all bidding ceases for a particular item. Bids will not be accepted after 30 minutes from bid deadline unless time stamp shows that it was made before the deadline.

2) I will post updates to rec.games.video.classic at least every other day. I will also e-mail the list to all bidders. E-mailed updates will be sent once a day (more if item gets a lot of bids). During the final 48 hours, updates will be more frequent.

3) Do NOT bid on an item unless you are prepared to honor that bid and buy what you bid on at that price. I expect bidder to act honorably--bids not made in good faith hurt all others involved in the auction--so if you don't intend to honor your bid, don't make it. Bids may only be withdrawn if I have not yet sent out an auction update that includes the bid. Otherwise, once a bid is submitted, it may not be withdrawn and I expect that it will be honored in the event that it is the high bid.

4) All cartridges are in working order. All other applicable items will be included only if mentioned. Item condition will be noted if applicable.

5) In case of ties, the first bid received is the bid accepted.

6) Cartridges are loose (ie. without box and manual), unless specified. Some labels may have minor defects.

7) Buyer pays shipping. Once the auction is over, I will work out the details with the winner. I will only charge what it costs to ship the

package, no more.

8) Payment is by check or money order ONLY, and in US Funds. It should be sent within 7 days. If payment is by check, it must clear the bank before shipment goes out. Allow 7 to 10 business days for checks to clear. Canadian bidders should send a Canadian postal money order, payable in U. S. Funds.

9) Place a bid by item number and description. Your first bid must include your name, address, and phone (I will provide same at the close of the auction to all winning bidders). I will use the first part of your E-mail address when listing bids. If you wish to remain anonymous, tell me what name you would like to use and then remember to remind me of it each time you send me e-mail.

10) Bid increment is $.50 on items up to $10.00, $1 for items $10.01 to $20.00, and $2 for items $20.01 and up.

11) Auctioneer reserves the right to correct mistakes made in the posting of this message or along the way.

David, did you really need to control a reply or did you mean relay?
I've done this before, & for a relay you really need a transistor
to supply enough drive. I prefer a PNP to NPN since when the
computer powers up, the 5V going to the base of the transistor will
prevent the relay from switching on. I'll assume you have the pin out
from either the FAQ or a tech ref. You don't need to add a resistor
between the joystick port & the base of the transistor since there
are internal resistors on the Atari, but you should add a diode
across the relay to prevent voltage spikes. To turn all 8 possible
pins into output, the trigger inputs & paddles remain input.

```
10 POKE 54018,48
20 POKE 54016,255:REM ALL OUT'S
30 POKE 54018,52
```

Now anything you poke to 54016 should be reflected on the JS port.
For instance:

```
10 FOR N=0 TO 255
20 POKE 54016,N:NEXT N
```

Will cycle the pins their full range.

Speaking of Percom drives... my first Atari8 disk drive was a Percom AT-88 (I -think- that's the model number; anyway, it's SS/SD 5.25"), and I got tired of it (it's bulky and has some quirks, for instance it doesn't write the same pattern to newly-formatted sectors, as do other Atari8 floppy drives) and traded it to a friend. Later, but not MUCH later, I seem to recall, I read HERE that you could rip the existing drive mech out of the Percom and replace it with "other" mechs -- IBM? I vaguely recall some scuttlebutt about putting a 3.5" mech in there.

At the time, I couldn't do anything about it, having given away the drive, so don't think I even saved the article. However, I recently had the opportunity to retrieve said drive, and did so, on the off chance that I DID correctly remember the possibilities and MIGHT be able to modify it in "interesting" ways such as making it a 3.5" drive.

So... can anybody confirm or refute that this was ever discussed here, or that you can put a 3.5" mech in a Percom AT-88 and use it on the Atari8? Failing that, what OTHER "interesting" changes can be rung on this drive? I consider it a 100% guilt-free guinea pig; if I burn it up, c'est la vie!

: Can some one tell me how to control the joystick ports in Atari
: Basic. I need to control a reply off of them.

: David

Okay, let's see if I can remember this:

The Basic commands you want to use are STICK(x) and STRIG(x) where "x" is the joystick port number from 0 to 4. Usually you work with STICK(0) and STRIG(0), that's the far left port.

So if you say A=STICK(0), the variable A will be set equal to whatever number the joystick is returning at that time. The numbers are (now here's where my memory is probably going to falter):

14:Up
13:Down
15:Central
11:Left
07:Right
10:Up Left
9:Down Left
6:Up Right
5:Down Right

If you take apart the joystick, you'll find out that there are four contacts inside which determine what the number is. If you press them down in a way that the joystick could normally never be used (say, press down the left and right contacts separately, or all four at once) you'll get an "impossible" number like 12, 8 or 3. There are four contacts and therefore sixteen binary possibilities. My guess is that "up" is 1, "down" is 2, "left" is 4 and "right" is 8. These numbers and their combinations get subtracted from 15.

STRIG works the same but it's for the joystick fire button. Zero means it's being pressed down, one means it isn't.

The 1.44 'Might' work but only as a 720K drive. I not going to go into
the differences here.

See my previous posts. Yes you can put in 3.5" drives in the RFD-40S1's,
so I would assume it is possible in the AT-88's. The problem I'm seeing is that the
Controler of the PERCOM's doesn't appear to be able to do Double Sided (720K).
You can also put in 5.25, 360K, half height drives but here again, no DS'ed. Still
waiting on someone to respone that has actually gotten Double Sided to work on
the RFD-40S1. OR, has a RFD-44S1. The extra '4' means that it is Double Sided.
In fact, if you make your own 34 pin cable, you can string 4 drives off of
one controler and if you use 3.5", the power supply of the PERCOM should be able
to handle all four. Just have to patch each drive to it's correct Device #.
I'm trying to gather as much information on the PERCOM's as possible and
am in the market for one of the Double Sided drives if anyone has one for sale. Still
haven't gotten ahold of Ben Poehland.

I have a Percom RFD-44S1, but I've never experimented with 3.5" drives in it - I've only added additional 3.5" drives. The only 3.5" drive I have is the 1.44MB floppy in my PC - I suppose I could try plugging it into my Percom controller and see if I can indeed get 720kB from the 3.5". I doubt I'll get much of a chance to experiment with it before Christmas - if Rich keeps sending me email it may just prod me into action. :-)

As far as contacting Ben Poehland is concerned, he may be somewhat inaccessible from the net for a while. He has decided to withdraw from the Atari community and sell off most of his 8-bit equipment - in fact, I believe most of it has been sold already. Over the next month or two he'll be replacing his Atari with a PeeCee clone and indicated to me he might be off the net for a bit while he's making the changeover.

As far as gathering as much Percom info as you can - Ben wrote an article in the previous issue of the new Atari Classics (which I have a copy of) which I consider the de-facto standard document for Percom users. If you have a Percom but don't have a copy of the article I'd urge you to pick up that issue of AC as quickly as you can. I can't remember the details of the article too clearly, but he may even have mentioned the various options available for replacing drive mechs in both the AT and RFD series of drives.

cliffl@mail.netshop.net (Cliff Lawley) wrote:
>Thirdly, the signal going to the TV is really crappy. Is there a way
>to tune it a little better?

It might just be an interference problem. Does it make waves and distort
and make you just sea sick? Here's a very easy fix that works well.

****snip*
Making your own quality RF Filter for your TV

* Cut some cardboard (cereal box type) about 1/2 inch by 6 inch.
* Roll it in a loop, and tape it at the overlap. You now have a loop about
2 inch diameter.
* Get some aluminum foil, and tear off a piece about 2 inches wide down
the length.
* Place the cardboard loop at one end of the foil on a table. On both sides
of the loop, wrap/crinkle the foil up around the loop just at the bottom.
Roll the loop forward and continue wraping it up in foil until finished.
* Congratulations. You have made a good RF noise filter for your TV set!

It should basically be a shiny doughnut of aluminum foil.
What do you do with it you ask?

Go to your RF Switch box on the TV set, unplug the RCA cable (what hooks up
to the video game) and put about 2 feet of cable through the filter doughnut.
Then take the end of the cable and loop it through the doughnut again.
Do this so you have 5 to 8 loops of cable going through the RF filter. It
may not be easy, but do it without destroying the filter. Then plug the
RCA cable back into the switch box. The filter should be close (less
than 1 foot) to the switch box for best effect. This is why you use the
tv end of the plug. Your picture should be much clearer! ENJOY! --bmcbrine
****snip*

I know many of the people here already know about this little dingy,
but it really helps to know this if you don't already.
My 800XL already had one of these RF filters. It's in the little box
that says "computer end" or something that's on the tv hookup cable.
It makes a Big difference if there isn't one. Makes 2600 playing really
enjoyable again!

Have Fun!
l8r...

Hmmmm.... getting hung up on definitions. But maybe taking a look at other systems wouldn't be a bad idea. For instance, the IBM PC called its boot strap program ROM BIOS. It was all you needed if you wanted to boot to basic in ROM so really, all the I/O & functionality of the Atari was there. It would have also been possible to design the Atari w/o any OS, just have the cart address space moved to $D800-$FFFF with nothing but hardware below it. I believe CP/M was similar in that most machines would start the screen & at least attempt to boot a disk. I think what has happened is we're starting to suffer from "MS speak" i.e. what they say is an OS is an OS. In their interpretation, everything they add that stands between you and the computer is part of an OS, something that I don't readily accept. Shell, GUI, ...? should not be lumped into the OS classification, maybe be lumped into user interface.
Which reminds me<g>. Has anyone done any significant hacks of the OS? I be thinking, the Atari translator disk would be a good start since it is freely distributed. There isn't that much that has to be hacked, but for instance, at least one of the translators still wastes time reading joysticks 3-4 & the paddles for those ports into their ram shadows. Kind of superfluous/waste of time. Ditto for the XL OS only instead of reading the ports, it just copies 1-2 into 3-4. I know there's a lot of talk about 4 player games, but I've never played one in 4 player mode so I wouldn't miss it. There's also the Fast Chip ROM replacement routines which I think are PD now. My idea of a better way to do things would be something like the translator OS with the fast chip routines hooked in, then maybe doing something like using the $C000-$CFFF for some flags. You could do stuff like only enable it shadow locations *if* you weren't reading them directly, eliminate the checks for "ERROR 141" to speed up the graphics. I've always wondered, maybe John knows this one off the top of his head, if you could do something like have the inital boot load a RTS somewhere in low ram, then JSR to it as part of the VBI process. What you'd do to enable your VBI vs the accepted practice is load the address of your routine in the next two locations, then just poke a JMP into the RTS locations. Since your only updating one byte, I can't see it would crash as having a interrupt occur while you're changing a 16 bit vector.

I recently purchased an Atari Assembler/Editor cart, unfortunately I
didn't ask for any documentation, so I'm stuck at where to begin. I've
assembly experience on other processors (6809 in school, at work I do
hand-tuning of assembly on the Pentium processors..), and I've
documentation on the 6502 instruction set. I just need to know how to
woek with this specific assembler (I've already encountered 'LIST' and
the fact that the lines of code like to be numbered ala BASIC..).

Plodding about through the FAQs and variety of web pages hasn't turned
up anything useful. Does anyone have a pointer to the documentation for
this cart?

thanks,
tom

3739. Percom 3.5 mod

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-25 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9511250213591.DLITE.bjcorr@delphi.com>
Source record: 87461

Since there has been so much talk on the subject, I'll donate my experience. I have an RFD40-S1 that i picked up used at a nearby shop and placed a 3.5" 720K drive in it and got 720K of storage. Ben Poehland told me I must be mistaken, that I could write 720K, but could not read it back. This was not my experience. I also told him that I had ROM version 1.2 in it, which Ben felt was not standard. The drive now has a pair of Chinon 5.25 360K drives in it (running happily from the one PS) so I can't at this moment verify this once again) but over the holidays I will refit the 3.5" just to check again.
I found the storage space great, but access times were slow (but reliable!)

Ben has indeed been selling off his atari stock, I purcahsed several of the drives from his AC article (that article is definitive) as well as his Percom manuals (and some of his notes). If copies of the manuals are needed, get ahold of me via email, but they are just the factory manuals that came with the drives. Useful, but not deep.
bjcorr@delphi.com

3740. Re: PERCOM Disk Drives

Newsgroup: comp.sys.atari.8bit

```
: So... can anybody confirm or refute that this was ever discussed here, or
: that you can put a 3.5" mech in a Percom AT-88 and use it on the Atari8?
: Failing that, what OTHER "interesting" changes can be rung on this drive?
: I consider it a 100% guilt-free guinea pig; if I burn it up, c'est la vie!

I have a At-88 here w/ a TEAC 720k mech that works perfectly as a 360k
drive. To get the full 720k you need a double density controller, like
the RFD-xx drives have.

3741. APE 1.07 works under Linux

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-25 00:00:00 UTC
From: classics@seka.nacs.net
Message-ID: <496e77$se8@wariat.wariat.org>
Source record: 87463

Many people have asked me to make a native *nix version of Ape. Well, i
doubt that will happen anytime soon but as I type this over my PPP connection
to my Linux box, Im running a disk copy program on another console
in APE.

APE seems to run quite nicely under dosemu 0.60.x with a few small
modifications.

1) In the dosemu-60.x/serial directory, edit the file ser_defs.h and
change the following values:

a) The line #RX_READ_FREQ. Change the value shown to 19L.
b) The line #MS_MIN_FREQ. Change the value shown to 19L.

This will change how often dosemu updates the serial port status
registers for your dos box. We need FAST updates. Change it to
1L if ya feel like it :)

2) In /etc/dosemu.conf, emulate ONLY ONE SERIAL PORT. Comment all the
other ports out. If you enable 2 or more ports things get choppy as it
takes longer to update the serial registers.

3) (Re)compile dosemu and install it, run it, and run APE.

APE should work OK for you. I have /dev/ttyS0 emulated, with
'sillyint' set to off. Setting sillyint to the IRQ of your serial
port might yield some improvment if you still have trouble.

Now the bizzare part. The higher the priority you give 'dos', the
WORSE ape runs. If you set the priority with renice to say '14' then
APE runs so good even APE+ 56kbps ultraspeed works. Amazing.

Well, have fun. Ive been working for about 1 hr now on the linux box, with
APE running the Apple Bandits demo at priority 14, without any disk errors
at all each time it does its reload (about every 15 seconds).

Oops, this is on a 486/DX-100. Cant promise anything on slower machines.

3742. Re: PERCOM Disk Drives

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-25 00:00:00 UTC
From: classics@seka.nacs.net
Message-ID: <496f1p$se8@wariat.wariat.org>
Source record: 87464

: > You have the Single Density version of the Percom drive. But ALL percom drives
: > support DOUBLE SIDED 80 TRACK OPERATION. You can still hook up and 3.5"
: > drive but you will only get 360k instead of 720k. All Double Density
: > models are serial numbered RFDXX-sY where XX is the number of tracks
: > on the mech ORIGINALLY installs, and Y is the number of SIDES on the mech
: > originally installed.
: >

: These are Double Density PERCOM drives with the switches to force Single
: Density but, like my INDUS GT's, I leave them set in the DD position. The second unit
: I have and it's Slave are both Double Density, Single Sided drives. Mine I received with
: no drives in it. I have installed 2 - 3.5" 720K drives and they 'seem' to format, BUT,
when
: you write to them, they start failing, Time Outs (No Device Connected) when the Disk is
: half writen (360K). This suggests that the controler can not really handle Double Sided
: operations.

I dont understand the setup with master/slave percom drives. The drive I have
had the external controller connection when I got it, but it was nothing
but an extension of the drive cable to the outside of the unit. Any
'slave' drives would just be PC type drives outside the case. All my
720k mechs fit inside quite nice :)

Have you tried removing this board? As I recall it had a couple terminators
on it or something, might be messing with the lines that select the head
to use.

There may be some diffrence in the mechs you are using also. Mine are all
TEAC mechs I got at the same time. They may be doing some sort of
translation with the track numbers or something. This I doubt, but it is
a possibility.

The disks I have however were heavily used and are full up to 720k with all
the data intact.

>Yes, I can 'talk' to both of them, but it appears like the controler can only
: handle Single Sided drives. I can Force them to take more data if I only copy 1 file at a
: time but even then, sometimes I get the error. I suspect this data is going to the same
side
: already written. The DOS Directory is just being filled in as if it were Double Sided,
the
: way that it was FORMATed.
: Question: What is the EPROM Ver #? Mine is marked as "V 1.20"

Mine is labeled V1.20 DD65 2/84

Do you have a long or short controller? The AT-88's i have all have a real
nice SMALL controller board, where the RFD drive has a controller that
goes the entire length of the drive.

: > These drives work fine w/ SpartaDos as well (no ultraspeed).

: Yes, I'm using SDX, 80 tracks, Double Sided, Double Density, Standard
: Skew (No High Speed Mode).

: >
: > The only modification to the above directions for DD drives is that the RDF
: > drives have dip switch settings to control the 'drive offset'. You can adjust
: > these so that physical drive 1 is atari drive 5, etc. these switches are
: > not present on any of the SD drives I have owned.
: >
: I haven't seen these either. I suspect a different UCode for the Double Sided
: Controlers.

The dip switchs on my 720k RFD are DOWN-DOWN-UP-UP. I once had the manual
describing what these did but its buried somewhere in this mess :)

The Atari memory self-test doesn't test the top 16K of RAM, and when
Basic is enabled, it doesn't test the RAM under Basic. 40 blocks would
be normal with Basic enabled, but it's odd that Basic doesn't work on
your machine. (The Basic Rom chip might be bad, but I would expect the
ROM self-test to catch that). If you run the self-test with Basic
disabled (hold down Option while turning on the computer with no drives
turned on) you should see 48 blocks on the self test.

Classic Game Stuff for sale.....

2600, 400/800 and Fairchild stuff for sale.

2600, shrinkwrapped

Big Birds Egg Catch, shrink wrapped box $6.00
Desert Falcon, shrink wrapped box $2.00

2600, loose

Maze Craze $1.00
Taz $2.00
Squeeze Box $2.00
(cart has a corner missing on the bottom)

400/800

Pacman cart $3.00
Eastern Front cart $3.00
(I have four of these)
Home Filing Manager, shrinkwrapped. $5.00
5.25. disk. (I have three of these)

Fairchild Channel F

Video Cart 5, Space War $3.00
Video Cart 9, Drag Race $3.00

Shipping and handling is not included. Shipping for loose carts is
$1.50 for the first and $.50 for each additional. Shrinkwrapped items are
$2.50 each.

3745. Re: SIO2PC problem

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-25 00:00:00 UTC
From: classics@seka.nacs.net
Message-ID: <497hnd$8nj@wariat.wariat.org>
Source record: 87467

Sven Gleich (sgl@hrz.tu-chemnitz.de) wrote:
: Hi outthere,

: I have the same problem which Stefan described.
: I tried to get closer to this problem and used different
: PC-Configurations.
: First of all my system:
: PC 486DX2/66
: 8MB,Vesa Local Bus, 1MB SuperVGA
: and a 16450 UART
: Atari 800 XL, 320 KB, Floppy XF551, SIO2PC Cable with MAX232

Are you using the 1 chip or 2 chip Max232 design? If your cable includes the Hex Inverter then first make sure you are using the sio2pc2 program, instead of the sio2pc.com program.

Not to blow my own horn too loudly, but you might want to try APE and see if you have better results. Though there are major bugs in 1.06, so you might want to wait a few days for the 1.07 release.

In any case, lets try to get SIO2PC working for you. :)

: I use the newest version I found at UMICH , SIO2PC 3.19i.
: The file SIO2PC.COM works and the Atari uses the virtual diskdrives
: (with some problems I describe later), but the File SIO2PC2.COM
: does not work.

Then I assume you have the 1 chip, or a faulty 2 chip.

: Now my problem:
: The Atari doesn't work together with the SIO2PC2, the Atari is not
: able to find the virtual drives at the PC, it sounds like the famous
: booting noise if I try to get access to the virtual drive.

Same as above. If you have the 1 chip, sio2pc2 wont work for you, as it has support for the tri-state inverter. Sio2pc.com and Sio2pc2.com are the same program, with Sio2pc2.com just including some code to 'open' and 'close' the tri-state in the 2 chip cable. If you have the 1 chip use sio2pc.com, if you have the 2 chip and sio2pc2.com is not working, you need to review your cable construction.

: If I use the SIO2PC.COM, the it works under a disk copy program at
: the Atari fine, it is possible to copy from and to the XF551 and
: a from a virtual drive 1 to a virtual drive 2 without errors at all.
: The diskcopy software even uses Highspeed at the virtual drives
: altough the XF551 is not capable of this.

: But if I use a DOS like DOS 2.5 or BIBODOS 6.4 / 5.4 the reading
: process works fine, but if I try to write longer files (about 100
: sectors or so) the DOS sends me an error.
: Describing the errors:

: At the PC runs SIO2PC.COM with 2 virtual drives (configurable,
: density Medium)
: and at the Atari runs BIBODOS 6.4 RF (special DOS for using the
: fast speed with XF551 and detecting the correct density of a disk).
: If I copy 3 files from vdrive (virtual drive at the PC) 1 to
: vdrive 2 then file one with 15 sectors works fine, but copying the
: next one with about 100 sectors causes an error #139 after reading
: a few sectors.

I assume you are getting an error reading the virtual disk, and not
reading the XF551?

: The vdrive 1 disk is error-free, all files are correct there.
: The BIBODOS 6.4 RF doesn't use the Highspeed transfer.
: If I use BIBOOS 5.4 RF (written for Speedy 1050, uses Highspeed
: at the vdisks) the same as above, but an error #164 follows.

I cant help with this, Im not sure if Sio2pc supports anyting but
2x 'spartados' type ultraspeed. If you want Speedy/XF551/Happy 2x
SIO emulation, I suggest you check out APE.

Your disk may be error free, but if your getting the Device Nak (error 139?)
on exactly the same sector each time, the 'next sector' link on that
sector of the disk image may be incorrect, and pointing to a
non-existant sector, like 4000 or something. This would cause
sio2pc to NAK your sector request.

Have you tried with other disk images?

: Trying the same with DOS 2.5 an error #164 occurs too

My Mydos Tech Manual says error #164 is a bad file link #. I would bet
your disk image is corrupted.

: If I create at the PC a new disk in medium format and
: format this disk with BIBODOS 6.4 or 5.4 and the write the
: DOS-Files DOS.SYS and DUP.SYS at this 'fresh' disks no error
: occurs. The disks are bootable and running fine.
: Later on I disabled the internal cache of my 486DX but
: it did not help. I slowed down the PC with its TURBO switch,
: it did not help.
: The main reason for doing all this was that I wanted to
: create 1 or 2 huge disks at the PC and using them with the
: Atari. But most of my Atari 5.25 Disks are in QUAD format,
: the special one of the XF551 and now I want to transfer the
: files to the PC, and it has to be done with a DOS I think.

First, if your not getting errors on any other disks, then you definatly
have a corrupted disk image. Second, is 'quad' density a DS/DD 720k

format? If so I suggest you create 720k disk images and use
a DD Sector copier like MYCOPIER.COM to just sector copy the
disks from the XF551 to your size-matching disk image.

: I can't use a sector copy because the format changes.

This is not important. The Atari computer requests sectors by their
ordinal #, like 500. It cannot tell how they are stored on the disk, and
frankly does not care. They could be on a floppy disk or a HD, if the
Atari gets sector #500 when it requests it, all is fine. The disk drive/emulator
is responsible for finding/translating sector '500'.

Dont even worry about this, just use a sector copier.

: Is there any Atari-DOS which can read XF551 created disks
: (Single, Medium, Double AND Quad) and also can create
: huge disks at a vdrive from SIO2PC.

If you cant create a 720k disk image with sio2pc (im pretty sure you should
be able to), again, pick up APE and try it. Also get MYCOPIER.COM, its
about the best sector copier available.

: I think the filesystem must use subdirectories and I need
: a Micro-DOS for this file system too.

If you sector copy the disk image, it will be an exact copy and you can
use whatever DOS you want on it, just like tou would the original.

: I have a lot of really nice sound and graphic demos and
: I wanted to collect them at a huge disk.
: The Micro-DOS can provide at the booting process
: of an atari disk a little menu to select the program to
: start and uses only a small amount of memory for the
: loader routines.

: Can the SIO2PC program create huge disks which an atari dos
: can use (I tried this but it does not seem to work) ?

Large disks has always been a problem with Sio2PC. Its possible to
get the 'standard' large disks like 720k to work under Mydos and
spartados, but above that I think there is a problem. Using APE
you can create and format disk images upto 16 Megs with mydos or
spartados. APE works 100% with Sparta's HDINIT, and with the
high capacity option of MyDos. (4.53 is what I have)

: Can the QUAD format integrated at the SIO2PC program ?

The format, again, is unimportant. All you need to worry about
is 1) the density, double or single (256 or 128 bytes per sector), and
2) the TOTAL number of sectors on the disk. Create your disk image
using these values.

: And what is wrong with these DCM files ? I loaded down
: some at university and tried to create the disks but the

: diskcommunicator 3.2 from Robert Puff always found BAD BYTES
: in these files. I get the DCM files at a single file, how
: can I get them on an vdisk file .ATR ?

DCM is a compressed disk format. You need to convert these images to
the uncompressed .ATR format for use. There is a dcm2atr.com program
available that does this, or APE has its own DCM->ATR converter built in.

: Is there any possibility to check these DCM files ?
: If I use this DCM2DSK program my PC hangs up or is rebooting.
: The DCM2DSK displays some lines with SECTOR 1, SECTOR 2 ...
: and sometimes, not always, a line ERROR IN HEADER or something
: like that occurs.
: Does anybody know the structure of such a DCM file ?
: Maybe I can write a program for DCM to ATR ...

I dont think the .DSK format is the same as the .ATR format. Get
APE or dcm2atr.com from umich and they will work OK.

: So, that were a lot of problems and I hope anybody can help
: me. I am really interested in using my little old atari
: with the PC stuff.

If you want to try APE, its in Atari/8Bit/Ape at archive.umich.edu. You
will probably find dcm2atr.com in the Sio2pc directory, or the
utilitys directory.

If the need any additional help just post or e-mail me.

Thanks

Steve

Yes, I have to long controler. One thing I have noticed: My controler
chip is a Western Digital, FD1791 and the bad one in the other drive is a FD1795.
Best Electronics stocks the FD1795 and I am waiting on it. (Sure wish he would
take VISA.)
Have you ever tried doing a 'Wild Card Copy" from a large Hard Disk
partition to try to fill the PERCOM drive? This is were they fail, about when the diskette
is half full. If I add indiviual files, one at a time, they do seem to be written to the
floppy. Still, 3 identical diskettes written and each has a different number of "Sectors
Remaining". Something is not right here.
>
> The dip switchs on my 720k RFD are DOWN-DOWN-UP-UP. I once had the manual
> describing what these did but its buried somewhere in this mess :)

Yes, that's the same way I've got them set up, assuming 1 - 2 - 3 - 4 .

>>>>
Thanks for the response, I'm still digging. Maybe it is the 1791 that's
causing the problem. When I get the new 1795 I'll give it a try in mine before I
return the the other unit and slave to it's owner. I already updated his EPROM
to v 1.20. It was at v 1.02 with a 1982 date.

Michael Kling asked me about making a simple program which presents the user with a listing of files (and subdirectories) on a MyDOS disk and lets them select an executable to start up.

Well, for some reason I did it (you know, rather than working on one of the dozen other projects I have lined up) and it works nicely! I still have plans for extra features (built-in text browser, for example) but for now it's pretty cool.

So if you, like Michael (and I), have a huge MyDOS disk full of programs hidden within subdirectories, check out "MyDOS File Selector".

It'll be up at UMich (in "Newitems") by the time you read this. :)

No no no! :) He wanted to know how to CONTROL the stick ports, not just
read from them. Look up address 54018 in Mapping the Atari or look in
a reference manual or something. From there, the pin controls are the
same as the inputs when you do the outputs.

3751. 815/disk format

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-26 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148134@cup.portal.com>
Source record: 87473

Mucking around again. Was at a surplus shop & they had a shoe box full of Atari 815 DOS disks. So I picked one up & tried to boot it from a 1050, no go. Tried my ATR8000, no go. Went in with a sector editor & I recognized the format, everything was inverted i.e. XOR $FF. Does anybody with an 815 know if this is the way the disks are supposed to be or was this just a batch of disk that were improperly made? I'm going to continue burning some free time on it, just enough to rewrite the disk in standard format & see if it is the same as my copy of Atari DOS IID. I also need to know how the checksum is calculated on an XL OS. I've never patched more then a few bytes & a time so I'm having a little trouble with it. It seems to calculate checksums equivalent to two 8k EPROMs vs a 16k, probably a hold over from the 1200xl. I'm assuming Whoops! Flipping though Mapping & I just found the info I need. Routine for the first 8k ROM is at $FF73.

Sure will. You will need SpartaDOS or MYDOS or one of the newer
DOS"s to Format them. Oops, I almost forgot, they must be to ones with a
34 Pin (2 rows) connector. Some in the the SF354 only had a single row of
pins. (Still haven't gotten around to figure out the signals to see if the single
row connector will match up to a normal drive.)
And remember, no High Speed Mode.

3754. Fast Floating Point routines

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-26 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148137@cup.portal.com>
Source record: 87476

Another OS hack/post. What I did was take the FASTFP.OBJ file that
was contained in the .ARC on umich & the ATARIXL.ROM from the XF25
emulator. Just did a simple basic program to stip the header from
the FASTFP.OBJ file & read use it to patch the ATARIXL.ROM file. You
just need to replace ROM bytes $D800-$DFFF with the FASTFP.OBJ
data. This is at an offset of $1800 from the start of the ATARIXL.ROM.
Next you need to take care of the checksum. What I did was use
DEBUG to edit the patched ROM file. I changed the ROM locations
$FF89 to 4, $FF8D to 0. What this does is force all the branches
to the routine that indicates a good ROM no matter what the checksum
is. What I should'a done is eliminate the checksum entirely or replace
it with some code I'd find useful, but much later for that. I want to
do a few more hacks on the OS before I start burning real ROMs anyway
so falling though to alway reporting a good checksum suits my purposes
for now.
RESULTS!
OK, I only tested this patched ROM on the emulator, but I double checked
everything with a real 800XL equiped with both OMNIMON which has built
in fast FP routines & a stock OS. The time improvements were within a
few percent of each other for both the real Atari & the XF25, even though
the absolute times varied.
A simple loop like:
```
10 POKE 20,0
20 FOR N=0 TO 1000:N.N
30 ?PEEK(20)
```
Runs about 7-8% faster. Something that is floating point intensive like
```
10 POKE 20,0
20 FOR N=0 TO 10:X=2^2:N.N
30 ?PEEK(20)
```
Showed a 400% improvement in speed. Anyway, the way things are laid out,
the only way the ATARIXL.ROM can be distributed is with the complete
XF25.ZIP so if somebody wants to patch their ROM file, they have to do
it themselves. Ditto for stuff like FIXXL or Translator which are
technically patchable but not hackable. You should just be able to run
something like FIXXL which switches your system to a RAM based OS & then
do a binary load of FASTFP.OBJ from DOS since it has the load vectors on
it, but then you would have an 800 OS so stuff like GR.(15) shouldn't work.
Anyway, if there is anybody out there that still uses BASIC or FP nag me
& I'll write a patch file. Sometimes, this time for sure, copyrights
are a real bother. I can certainly see stopping someone from stealing
software, but a patched OS shouldn't be the same.

3755. Re: SIO2PC problem

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-26 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148142@cup.portal.com>
Source record: 87477

IMO: See if you can pick up APE from the archive at umich.edu, my thinking is if you experience the same problems with APE as SIO2PC then its probably a hardware problem with the PC or the cable. If you don't have any problems, well you've become an APE users.
$.02, I've found bugs in some versions of MyDOS when using the dup disk routines, Steve Tucker has found some bugs in Sparta DOS when using large disk images. No reason to believe a lot of DOS's don't have problems that never appeared before because 99% of their use was on 720 sector disks.
When I did have a problem a couple of times, I had the status line toggled on for SIO2PC. I found that for whatever reason it was cycling through all the disks IDs. Some like time [$31, $32, $33, $34, ...] after each time out. Eventually it would get back to an installed drive so what would happen is I'd get 6 time outs followed by two good STATUS commands & R/W operations. Scared me though & I shut down my system rather then mash a disk.

3756. BlackBox Info.

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-26 00:00:00 UTC
From: jeking@xmission.com
Message-ID: <49a231$920@news.xmission.com>
Source record: 87478

Still puzzled about doing hard disk partitioning on the black box (been doing it on an MIO for so many years).

If setting up say 3 40 meg hard disks, and you want to create as many 16 meg partitions as possible, would you partition like so:

```
# CTL Start Length
-----------------------------------------
1 A 17 65535
2 A 65536 65535
3 A 131071 65535
4 B 17 65535
5 B 65536 65535
6 B 131071 65535
7 C 17 65535
8 C 65536 65535
9 C 131071 65535
```

Or would you do it like I'm used to doing it on the MIO

```
# CTL START LENGTH
-----------------------------------------
1 A 17 65535
2 A 65536 131071
3 A 131073 160160
4 B 17 65535
5 B 65536 131071
6 B 131073 157439
7 C 17 65535
8 C 65536 131071
9 C 131073 173399
```

Does the Black Box "LENGTH" line really mean length of that partition, or does it really mean END SECTOR like the MIO?? Am puzzled about this.

Any help greatly appreciated.

3758. FS/T: Atari 8-bit computer items [11/26/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-26 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <4994bq$6dl@ixnews2.ix.netcom.com>
Source record: 87480

updated 11/26/95

I have the following Atari 8-bit software and hardware for sale or trade.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Postal Service. The shipping cost depends on both the weight of the package and the distance that it is traveling. Buyer has the choice of either first class or parcel post (which is slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless specified.

NOTE: Since all cartridges are used, some labels will have small defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 6.00 Atariwriter
$ 6.00 Basic
$ 7.50 Eastern Front: 1941
$ 7.50 Letter-Go-Round (Sesame Street) [CBS Software]
$ 5.00 Pac-Man
$ 5.00 Star Raiders

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio

Shack for $7, plus tax. It allows for the connection of both 300 OHM
and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with
it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply.

I will also throw in a second non-working ATARI 600XL for parts, FREE.

This is a complete system, except for RF switchbox and RCA cable.

$24.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox and RCA cable.

$44.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply.

This is a complete system, except for RF switchbox and RCA cable.

$34.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply.

This is a complete system, except for RF switchbox and RCA cable.

$59.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

Think I have the partitioning down now...

But now I have another question:

Will pushing the print dump button ONLY work if you have a printer
attached DIRECTLY to the BB, or will it work through the MUX or SIO port?

I hit the button again and again, but it only locks up my machine.

Hello - a week or so ago I hooked up my aunt's new color Epson printer.
I'm interested in getting such a beast for my Atari (and my PC might get
some use out of it every once in a while, but probably not :)).

I want to know:

(1) What's the best (price -> speed -> quality -> ease of use) printer
to get nowadays? I remember that the HP500 was a good one. Now jet
printers seem to be coming out of the woodwork, so what do you folks
recommend?
(2) Would DDIII be able to support any of it? I got a lot of good use
out of my old DDIII + XMM801 setup. I HATED it (slow!), but it still
looked pretty nice. Is it even worth using DDIII though, with these
built in fonts on printers? (Although from what I've seen, they aren't
scalable... DDIII at least has plenty of different sizes.)
(3) What about color? Would it be worth it? How about writing software
FOR the printer to print in color, assuming there is none. Any
experience color jet printer users out here in A8 land?
& (4) What's the best (most reliable -> cheapest) printer interface? I just
got rid of my only one; then a day later hooked up my aunts printer
and almost wished I hadn't. :)

Thanx in advance!

Sorry. I just had to add some info. After this, let this thread die, ok?

GIF doesn't loose data, but is restricted to 8 bits of information.
Which means only 256 colors. But if the original picture is a 24-bit
image you loose big time, as you have to reduce it to 256 colors first.

JPEG is 'lossy', but is a 24 bit format. Which means you propably
get all the colors you want.

I would say you loose far more data with GIF if you reduce a good
picture to 8 bit of data format. With JPEG you can vary the amount
of loss to suit your needs regarding compression and picture quality.
A 24-bit picture saved as a JPEG can look better and still be
smaller than the GIF equivalent.

GIF: Use for business graphics (as JPEG is at its worst with
graphs and other pictures with solid colors and sharp edges).

JPEG: Use for all photographic material. If people only have
8 bit screens, and want to reduce the picture to GIF to get
faster loading, let them do so themselves.

The dithering algorithm used when decompressing the JPEG file
will make a big difference. Just compare Sun's 'imagetool' (quick,
but coarse) with 'xv' (run with 'xv -perfect -8 -slow24' if you have
an 8-bit screen).

I would still recommend Hewlett Packard for printers, they make the best
printers, IMO. I have an HP660C (InkJet/DeskJet), works great, excellent
quality.

Hello Bernard! I usually see you on the FidoNET .... Yah! We tried
explaining to the auctioneers that their biggest market for buyers of 6502
hardware and software wouldn't be able to fit 50K of messages into their
text buffer, as the average size of a message text buffer on an 8-bit is
about 10 kilobytes maximum. Apparently the posters don't even wish to
reach their ideal buyers market, but prefer to hawk their wares to other
INTeL and Macintosh owners. It makes no sense to me either, but the
sellers probably don't even read this message base anyway; they merely
post here.

Your friend needs a Atari 410 recorder or a 1010 recorder, I have both in good working condition. Make offer shipped as to your xe, I also have disk drives, 810, 1050, Indus, Track, Rana at $24.00 shipped...price is the same for the old 810 as it weighs more..

your friend would probably be better off picking up a disk drive as the old tape drives take forever to load..

By driver do you mean disk drive?

If so I have several 1050s stock at $24.00 shipped, if you order
one will throw in 2 joysticks..

Source record: 87494

Hi there again,

thanks to all persons who helped me with my SIO2PC problem,
I really checked out the APE, but I found only version 1.04d.
But it is too early now for me to say special things, only
so much that it seems to be running veerrry goood but I need
more time to check all its functions (first I figured out
that the XF551 emulation seems to have errors - I tried XFTools,
would be nice if you would try it too). I will definitely spend
more time to get the stuff working...
And there will be a new article from me soon.
But there is another reason that I am posting a new article, it
has something to do with these .DCM files. Some of them really
work fine, the DiskCommunicator (DC 3.2) reported no errors.
But on some files they won't work at all. I get messages like
'Header unknown','Bad Sector Data' or 'No DCM File'.
I figured out that the files which worked fine had the
following first 4 bytes (headerbytes) : FA 01 01 00

But the files which would not work had : 1F 8B 08 00

Now my question: Did I something wrong as I got the files
from the ftp-server ?
Has it something to do with this UUDECODE/UUENCODE stuff ?
You see I am a really beginner at this point and I am also
new at university this year and my English is poor ...
What can I say, I don't know how to get these files
to a atari disk.
A try would be the file XFTOOLS.DCM which had a bad header
as I tried to de-DCM it.
The stuff I figured out about correct DCM files follows (not much
but maybe interesting):

all the stuff is not tested too much

1st byte density of the disk (and/or length of a sector ???)
F9 - Medium
FA - Single (or Double - don't know)

2nd byte maybe indicator for more than one DCM file
01 - just one DCM file
<> 01, e.g. 41 - the value in the filename
which has to be increased for
the next DCM part
e.g. part.1
part.2

.
.
.

3rd and 4th byte the sector in low/high byte notation, from which on
the following data should be written on disk

04 00 - 4th sector
0A 01 - 265th sector (I think ;-) but not sure)

I will try to get further into this subject and any help is welcome.
That's all for now

CU8er, Sven .

Setfan,

The 'ignored writes' problem is a known bug in 1.06, resulting from
a small change I made to the source code before I released it. The above
formatting and writing problem are the same bug, and are fixed in 1.07.

I have not make 1.07 available yet, but will do so within the next
few days. It also looks like the .PRO system will be distributed as
shareware was well, so look for that.

If you would like me to notify you by e-mail at the time I make it
available please let me know. I will also announce it here, as well
as provide details on the new .PRO system.

Thanks

Steve

: Hello - a week or so ago I hooked up my aunt's new color Epson printer.
: I'm interested in getting such a beast for my Atari (and my PC might get
: some use out of it every once in a while, but probably not :)).

: I want to know:

: (1) What's the best (price -> speed -> quality -> ease of use) printer
: to get nowadays? I remember that the HP500 was a good one. Now jet
: printers seem to be coming out of the woodwork, so what do you folks
: recommend?

Bubble jet works good for me. Though the ink cartridges for the
HP 550C I have are a whopping $30 each. I would suggest any of the
cannon 300dpi color ink jets, they are inexpensive, the ink cartridges
are less expensive and the output is very good.

: (2) Would DDIII be able to support any of it? I got a lot of good use
: out of my old DDIII + XMM801 setup. I HATED it (slow!), but it still
: looked pretty nice. Is it even worth using DDIII though, with these
: built in fonts on printers? (Although from what I've seen, they aren't
: scalable... DDIII at least has plenty of different sizes.)

I have a Epson emulator cartridge for my HP 550C, and it works 100% with
all my 8-bit stuff. I dont know if other printers are/have available
backward compatibility with the 'standard' dot matrix printers.

: (3) What about color? Would it be worth it? How about writing software
: FOR the printer to print in color, assuming there is none. Any
: experience color jet printer users out here in A8 land?

I have not use for color when using the 8 bit obviously, without a
specially programmed application. The color output is outstanding if
you use a nice ultra-white ink-jet paper.

: & (4) What's the best (most reliable -> cheapest) printer interface? I just
: got rid of my only one; then a day later hooked up my aunts printer
: and almost wished I hadn't. :)

APE is pretty cheap <plug plug>. :) I think B&C or somebody had the old
MPP printer interface for like $5. Otherwise your into a PR, 850, or
Black Box, etc.

: Thanx in advance!

Your welcome.

Steve

>on for SIO2PC. I found that for whatever reason it was cycling through all
>the disks IDs. Some like time [$31, $32, $33, $34, ...] after each time out.

In case you didn't know, this is also what MyDOS does when it's jumping back into DUP.SYS but can't find it.

For example, I boot up. I format my D9: RAMdisk. I write DOS to it (or copy DUP.SYS, but writing from RAM to RAM is quicker than copying from SIO2PC to RAM). When I run a program and then exit to DOS, I just hit BREAK a few times to speed up the cycling process until it eventually tries D9: and BAM! the menu's up on the screen.

From then on, it'll try D9:. If for some reason it can no longer find DUP on D9:, it'll start cycling again. It can be annoying ; you kind of think to yourself "just give up!" Then you think "well wait, what ELSE can it do??" :)

Other programs that work with the ST mouse-driver upgrade are:

o The update to G.O.E., the DIAMOND OS cartridge.

o The public re-release of G.O.E. (now called G.O.S. ?).

o 8-bit TOS (A mouse is mandatory with this OS, as it
is "pixel driven" and would take three to five minutes to
"walk the screen" to the exit button using a joystick. A
trackball would also probably work, as well.)

3780. Announce: Classic Atari Commericials on WWW

Hello, fellow Atari fans...

While unpacking my video collection after the last move, I found a tape
I had borrowed from my previous job. It was a TV special dating from 1981
about the 'computer revolution'. I popped it in and grooved on a time-warp
back to the feathered-back, parted-in-the-middle days of my early 80's youth.

Anyway, the kicker is that this special was sponsored by Atari, and so
it features what must have been their entire television promotional
campaign. The Atari 2600 and 8-bit computers are shown off nicely!

All six commercials, captured as QuickTime movies, are available via the
World Wide Web. They're ~3MB in size on average; sorry but that's the
smallest I could make them.

They are referenced on the "BRiTiSH Underground Atari 8-bit Page" at

http://nimitz.mcs.kent.edu/~clisowsk/8bit.html

Ironically, it's a U.S. site; the movies will soon have a European
home at Ivo van Poorten's "Atari Home Page".

Grin and groan; I did!

Tony R.

I also have a 660C and I agree, but for price, you might look at the 600C .
It was about $70 less and came with the color kit. The only difference is
that you have to swap cartridges to print color or black, where the 660C has
dual cartridge holders.

3782. : 8-bit floppy -> .XFD file; What's the easiest way?

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-27 00:00:00 UTC
From: aramos@cis.ohio-state.edu
Message-ID: <49cuv2INNo2l@fandango.cis.ohio-state.edu>
Source record: 87504

I want to try some old 8-bit disks on the Rainbow demo. Problem is,
Rainbow understands only ".XFD" files, not the more common ".ATR".
All the converter utilities I've seen make .ATR files.

What's the most painless way to make an .XFD file of an Atari 8-bit disk?
.XFDs are 92,160 bytes long, so are they simply direct sector copies?

I have a disk -> .ATR utility for the PC; if there is an .ATR -> .XFD
util I guess I could do it in two steps. >:-P

Just don't make me write an .XFD file creator on the 8-bit. The "SIO calls"
area of my personal memory bank is teetering on collapse. ;-)

Thanks all,

Tony R.

p.s. reply via e-mail if the answer makes me look stupid! ;-)

3783. File Selector v.0.0 has a bug already? :(

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-27 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <49daah$hv3@nic-nac.CSU.net>
Source record: 87505

Michael Kling, the person I wrote "File Selector" for, has already reported
a possible bug to me:

Under MyDOS 4.5, some programs refuse to run under File Selector,
UNLESS DUP.SYS has been loaded first. (ie, instead of
booting into "File Selector", it boots into the DOS Menu,
and from there you [L]oad "File Selector" manually).

I can't really understand why this is happening. If it's part of my "load
the executable" routine, all that does is call XIO 39 with AUX1 = 4. Perhaps
I'm using the wrong AUX1 value???

Well, anyway, he's going to try it with MyDOS 4.53 (which seemed to work for
me, but I can't trust anything since my main 8-bit is a 65816, and my alter-
nate 8-bit is a PAL; so I can blame problems on either of those without doing
major testing) so it might end up just being a 4.50 bug...

But - if any of you Action!-knowledgable c.s.a.8er's are bored, the source
code is sitting in the ARC along with the program and docs, so have to it. :)

(And don't worry, it'll look nicer/cleaner by the next version) :)

I currently have version 4.04 of SIO2PC. Nick Kennedy sent it to me
when I wrote him a letter (and added a shareware donation). I think
he does not use Internet himself, otherwise he would have posted this
version to the Umich archive or so himself. I do not understand why
people who are complaining about things that are not working right in
SIO2PC, do not write it down in a simple letter to Nick Kennedy himself.
I did, and the bug I reported was fixed in the version he sent me.
I am still having problems with it, as do some of my friends, but
if you do not write the author, how is he supposed to find out?
I was too busy to check out what my exact problem was, but if I have
time, I know where my comments should be adressed to.
But to answer your question, version 4.04 solves some of the timing
problems that are in the 3 series. However, on our Toshiba portable 486,
SIO2PC does not run at all, while APE does. We told Nick Kennedy this,
so we will see what the mail will bring soon I hope.

3789. WANTED :8-bit Kyan pascal documentation

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: Mariano Dominguez <mariano@fciencias.unam.mx>
Message-ID: <49fada$4lt@academ00.mty.itesm.mx>
Source record: 87561

Hola:
anybody has a copy of KYAN pascal Manual?
Photocopies or a .txt file is fine.
i have some programs for atari 8-bit, mail me fore software exchange too.
also Mexican atarians Mail me my old club sunks
TNX.

3790. Re: : 8-bit floppy -> .XFD file; What's the easiest way?

>I want to try some old 8-bit disks on the Rainbow demo. Problem is,
>Rainbow understands only ".XFD" files, not the more common ".ATR".
>All the converter utilities I've seen make .ATR files.

dcmtoatr handles xfd images as well. It is written in C, and works under
UNIX or DOS, and someone is working on a Mac version, which is on my ftp
site.

Try looking in: ftp://ftp.gate.net/pub/users/cmwagner/dcmtoatr

>I have a disk -> .ATR utility for the PC; if there is an .ATR -> .XFD
>util I guess I could do it in two steps. >:-P

You can convert an ATR to XFD by simply chopping off the 16-byte header from
the ATR image

Cheers.

3792. Interfacing my 8-bit to my Linux box

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: RLCOLLI@IBM.NET
Message-ID: <8n3uwksjYpAJ088yn@IBM.NET>
Source record: 87564

I'm going to be starting up a BBS in the near future, and I thought it would be neat to be able to hook up one of my extra Ataris to my BBS for the purpose (at first) of getting the current temperature. I do have one of those learning kits which has the temperatue sensor, so that part is not a problem. The problem is connecting my 8-bit to my Linux box. I think a SIO2PC cable is a little over kill for such a little project. My current ideas are:

1. Use one of those R: drivers that use a joystick port. I would need to find plans for the joystick-RS232 cable, and I would be limited to 300 baud, but that isn't a big problem.

2. Hook one of the joystick ports directly to the parallel port. This would give me probably two lines for data and two lines for handshaking. The problem with this approach is that it requires a lot more work on both ends for the software.

Any other thoughts? I'm planning on writing the software for the 8-bit in basic, since I just want something short and sweet, but haven't thought far enough a long for what I'm going to use on the Linux side.

Thanks.

3793. PERCOM Disk Drives

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: rbmier@winternet.com
Message-ID: <49g09k$9tj@blackice.winternet.com>
Source record: 87565

For anyone that is interested and have been following the discussion
on PERCOM Disk Drives: Today I found the problem.
I dug up at work an old SIEMENS Technical manual on the FD179X
series of Floppy Disk Controlers. The FD1791 is not capable of Double Sided
operation, the FD1795 is. Of the two Percom's I have, the one had a bad 1795
and the other had a 1791. Good enough for single sided, but not for handling
a 3.5", 720K Double Sided, Double Density drive. Works fine as a Single Sided
360K drive. This would also carry over to the 5.25", 360K drives. They will only
work as Single Sided, 180K.
Of course, to change the Percom drives to Double Side use and your's
has the FD1791, just change it out for a FD1795. It's on a socket so no big deal.
Just wish I had a cheaper source for them, $18.50 is a little steep (Best Elect.'s
new price on them).

>programs that support this type of setup? The joystick inputs values
>into the stick(0) and paddle(0,1). Any ideas? Thanks.

The ST mouse is compatible with the Atari trakball, so you can use the
mouse to control any program designed for the trakball.

One program that comes to mind that you can use it with is Missile
Command. Hit control-T, then use the mouse/trakball as your controller.

3796. APE 1.07 NOW AVAILABLE! :)

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: classics@seka.nacs.net
Message-ID: <49doji$img@wariat.wariat.org>
Source record: 87568

The shareware release of APE 1.07 is now available! :) This release includes the complete APE Pro System, which allows you to create .PRO images using any 1050 (or compatible) disk drive.

WHERE TO GET APE?

I just uploaded APE107D.ZIP to archive.umich.edu, and it will appear soon in the Atari/8Bit/Ape directory.

It will be a few days, and I am willing to e-mail a uuencoded copy of the distribution to absolutly anyone who requests it. Just send me e-mail at classics@nacs.net and I will reply asap.

REGISTERED USERS: You will need to re-submit your key information so a new keyfile for 1.07 can be created for you. This key will be compatible with all future version of APE.

Please submit your Name, Address, City, State, Zip, Country and Telephone number. I will generate a key for you and send it along with the new registered version of APE 1.07.

Thanks to the few registered users who encouraged me to keep working on APE, and to everyone who helped (and continues to help) in its delevopment!

3797. MUX-Window project rolling again! :)

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199511290227.SAA26696@zippy.sonoma.edu>
Source record: 87569

Last you folks heard of the MUX-Window project, I was only this far:

Window handling:
Open, Close, Raise
Graphics:
Line, Rectangle
Text:
OS Font, Special drawing modes

In the past few days, I've added!

Event handling:
Keyboard, Button, Expose
Graphics:
Circle, Ability to draw into windows other than the topmost
Pointer:
Joystick controlled, Raises windows
Special controls:
SHIFT+CONTROL+TAB to swap the top two windows

With this, I've made a simple drawing program which is very similar in both look/feel and code to one which my friend and I wrote for X Window!

Also, soon I'll be getting a MUX setup, so I can become a little more free (I'm SO running out of memory :)).

Look for updates on my home page by this weekend!

On the 550C there are 2 cart ports just above the user controls for page
eject etc. They are normally covered with little anti-dust inserts, and
you have to remove one to insert a cart.

I would assume your printer must have these somewhere, as these are also used
for extra internal fonts and such.

D'oh! I knew it. I forgot to mention the file name before I posted that message, but I figured it'd be obvious. (And oops, it's not in "Newitems", it's in "New").

Now, if you're up for a challenge, don't read any further and see if you can find it yourself. :)

It's called "filesel.arc". Again, it's had a little trouble, but it could just be the version of MyDOS. For best results, try MyDOS 4.53. Good luck!

Bill; Thanks for the MyDOS info. It's been so long since I used anything but SDX, I'm getting pretty lame using a standard DOS. For instance, I am usually on one of my 256k XLs, but 90% if the time I forget to create a memsav so I lose whatever I was doing when I pop into DOS. I still haven't even got anything but a 64k ramdisk for MyDOS set up. One of Steve's versions of APE uses the DSR line vs the RI & this has eliminated most of the problems I've had with SDX & NAKs, haven't bothered to upgrade to a newer version of SDX yet. Steve's also got the high speed I/O working with MyDOS well & I can't get it to work under SDX 4.19 that it's put me back in the DOS decision confusion state. If only you could have two carts plugged in at once with MyDOS!
Rick

Hi again,

Steven Tucker (classics@seka.nacs.net) wrote:

>Are you using the 1 chip or 2 chip Max232 design?

I am using the 1 chip Max 232 design which is described in
the SIO2PC38 (should be version 3.18 I think) archive,
the name of the file is 1SIO2PC.ASC to 3SIO2PC.ASC, made by Nick Kennedy.

>In any case, lets try to get SIO2PC working for you. :)

This is really nice and I am pleased to hear this.
I will spend a lot of time beside my study to reach it.

>Then I assume you have the 1 chip, or a faulty 2 chip.

Right.

>I assume you are getting an error reading the virtual disk, and not
> reading the XF551?

Absolut correct, first I just tried to get two virtual drives working right.

>Your disk may be error free, but if your getting the Device Nak (error 139?)
> on exactly the same sector each time, the 'next sector' link on that
> sector of the disk image may be incorrect, and pointing to a
> non-existant sector, like 4000 or something. This would cause
> sio2pc to NAK your sector request.

But if I boot from the first vdrive and running all programs which are on it
everything works fine. No errors in loading and executing the software. I did
not try to use a disk editor for checking the file and sector links but it
should not change the result anyway.

>My Mydos Tech Manual says error #164 is a bad file link #. I would bet
> your disk image is corrupted.

I did not found any error. As I said the disk ran fine.

> Second, is 'quad' density a DS/DD 720k
> format?

No, 'quad' density is the 4th density of the XF551 drive.
Beside single, medium and double there is quad.
It means DS/DD (double sided-double density), that's
720*2 = 1440 sectors with 256 byte , approx. 360 KB.
And that is all without disk flipping (the XF551 has 2 heads)

>....
>This is not important. The Atari computer requests sectors by their
> ordinal #, like 500. It cannot tell how they are stored on the disk, and
> frankly does not care. They could be on a floppy disk or a HD, if the
> Atari gets sector #500 when it requests it, all is fine. The disk drive/emulator
> is responsible for finding/translating sector '500'.
>
>Dont even worry about this, just use a sector copier.

Yes, but I think if I copy 1 DD sector e.g. #160 the it is not sector #160 at
a single density disk because of the SD (128 byte) sectors.
E.g. sector 4 on a quad disk is the same as sector 4 and 5 on a single disk,
i think the disk copy at the atari does not any transformations.
you can also think of the directory of a disk, the file links would not be
right.
That is what I wanted to express (my english was wrong I assume).

>The format, again, is unimportant. All you need to worry about
> is 1) the density, double or single (256 or 128 bytes per sector), and
> 2) the TOTAL number of sectors on the disk. Create your disk image
> using these values.

For the software running at the pc - this is right.
But a copy-program like XFTools would not write a quad disk loaded from the
real XF551 to a double density disk in the virtual drive created by the
pc.XFTools must have a quad disk 'on the other side'.
I know, a file copy with a DOS doesn't bother about density as long as it can
identify the density.

>: And what is wrong with these DCM files ? I loaded down
>: some at university and tried to create the disks but the
>: diskcommunicator 3.2 from Robert Puff always found BAD BYTES
>: in these files. I get the DCM files at a single file, how
>: can I get them on an vdisk file .ATR ?
>
>DCM is a compressed disk format. You need to convert these images to
>the uncompressed .ATR format for use. There is a dcm2atr.com program
>available that does this, or APE has its own DCM->ATR converter built in.

Please read the latest article about this DCM problem.
But I notified now what I did wrong. First I got some a DCM file via UNIX
workstations and the DCM file had a wrong header after downloading it. Later
I tried the same file with DOS-machines and realized that the header of the
same file looked different (like it should look to proper function). Maybe it
has something to do with the unzipping stuff under UNIX - I don't know but I
used the workstation for a fast download, sometimes it is annoying to wait 30
minutes to get a 300 KB file. In both cases I used Netscape.

>If you want to try APE, its in Atari/8Bit/Ape at archive.umich.edu. You
> will probably find dcm2atr.com in the Sio2pc directory, or the
> utilitys directory.

Yes, I tried it and it is really great. My words in english are too limited to express my feeling about this fine piece of work.
Finally I got the version 1.06d from UMICH (hard 'cause of busy net and slow lines to America - I am from germany/europe. first i used a mirror somewhere in the u.k. there i could not find the 1.06d of ape...)
So I look forward and test this program. As I said it seems to be very good and does not produce any errors. I wrote in my DCM article that the APE had probably problems with the XF551 and now I got the 1.06 and I saw nobody complained about this thing (I could not I am new here ...) but finally it is fixed and today I will try it (if I come at home and don't spend my night at the PC-Pool ;-).
Some questions to Steven concerning the APE:

- If I want to purchase it, is there a special student price ?
- How can I cash - is a euro cheque enough ?
- Can I purchase it with email (I don't want to pay 9.50 $ for postage)?

That is definitely no 'commercial', I am really impressed by APE after all I am gone through with SIO2PC. Nothing against SIO2PC but maybe I have a 'bad' pc-stuff. I heard of a friend of mine, he is using SIO2PC and did not have any errors.

Beside the atari stuff if anybody finds a really big mistake I made in my english he or she can tell me, I always try to improve my english for better understanding.

Thanks,

Sven.

Source record: 87577

Buenos dias,

ok, it seems to me that I solved my problem alone but I want to tell
everybody, maybe there are others which had this problem too.

The described error only happened if I downloaded atari DCM files from
the net using UNIX workstations. If I download the same stuff under
DOS-machines the header looks correct. Maybe it has something to do with
the configuration of our UNIX workstations at university - i will try to
download the stuff from now on at pc's running DOS/Windows.

Bye,

Sven.

Actually this has been done. Diamond GOS by ReeveSoft. Very cool, if
somewhat limited in application though not potential.

3808. Press Release

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: nkey@free.org
Message-ID: <Pine.BSD.3.91.951127194027.20287B-100000@squeaky.free.org>
Source record: 87580

PRESS RELEASE PRESS RELEASE PRESS RELEASE

To all ATARI 8-bit users
who use SpartaDOS as their main
disk operating system.

My name is Nelson Nieves.

I want to announce my intentions
to support the ATARI 8-bit computer
users running SpartaDOS.

The programs are modeled after
MS-DOS and Norton Utilities programs
on the IBM platform.

This is a software only project, among the following programs in
development are:

vUnErase - view and/or unerase deleted files or directories; recover
partial deleted files to other disks or hard-drive partitions.

XCopy -- will use the extra 64k on 130XE computers for faster read and
write operations; SpartaDOS 3.2x users will be able to take advantage of
archival copies when used in combination with FAtr.

DeFrag -- a two part defragmentor with a separate directory optimizer.

I need to here from you! It is a critical moment. Your support will keep
this project alive. I have created a sample ARCed file which contains
several of the programs (that will be released commercially, in mid 1996),
a list of programs under development, and a questionnaire for you to send
along with $5.00 U.S. dollars. (If you can send $10.00 U.S. dollars, so
much the better!) :)

The file will be FTP-able in the future. For now you can send e-mail to
nkey@free.org. I will e-mail you NNTOOLS.ARC in MIME format. (Sorry, I am
using PINE on a shell account.)

For those of you who cannot receive e-mail file attachments send $10.00
U.S. dollars to:

Nelson Nieves ATTN: ATARI 8-bit project P.O. BOX 1702 Hatillo, PR
00659-1702

Questions? Call 1 (809) 820-3135. From 8 a.m. to 5 p.m. eastern standard
time. Ask for Nelson.

3809. Re: Assembler/editor cart questions

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: Sven Gleich <sven.gleich@mb1.tu-chemnitz.de>
Message-ID: <49f2ia$6g9@pyrrhus-f.hrz.tu-chemnitz.de>
Source record: 87581

Hi,

Maybe I know the assembler you have.
I know an assembler with the command LIST
and numbering the lines like in Basic.
Try also the command MON (for monitor).
The only strange thing is that I have the assembler
as a disk file called Bibo-Assembler.
But could it be that the commands and stuff are the same ?

Try it...

Bye, Sven.

3810. Re: Assembler/editor cart questions

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-28 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148262@cup.portal.com>
Source record: 87582

Tom, a little more then rusty & I haven't seen my docs lately, but this
should be enough to get you started.
For file i/o, it is LIST #D:MYPRO.SRC or #C: for cassette. The reverse
of this is ENTER#D:MYPRO.SRC You can also do binary saves/loads by
just giving the file name followed by the address range, but another
way of doing it is to just assemble to disk. That's where the .OPT
directives come in. They are something like
.OPT OBJ
.OPT NOOBJ
The default is OBJ for the ASM/ED cart, but let's say you have a large
program you are editing & the edit buffer is filled higher then where
you want your code to be placed. Just use the NOOBj <Or is it NO OBJ?>
directive & everything will be tested for being legal w/o the actual
code being generated to overwrite your text buffer.
The ASM directive defaults to the text buffer, but you can also
compile to & from disk, something like:
ASM #D:MYPRO>SRC,,#D:MYPRO.OBJ
A few other directives if memory serves:
.OPT TITLE rem so each page of listing has "name"
.OPT PAGE rem ejects a printer page
.OPT NOLIST rem shut off listing to screen, speeds assembly
.BYTE rem lets you add data type statements 2,$FF,3 or "Hello"
.WORD rem converts a number to 6502 lowbyte/high byte format
so something like .WORD $A000 will be => 00, $A0
.DBYTE rem $A000 become $A0,00
* rem sets where to start assembling i.e. *=$600 starts program at $600
SIZE well give you info about lomem, text buffer, & I think memtop, once
again, I almost always copile from disk to disk so I don't really
do stuff like set aside memory pointers so my .SRC & .OBj can
coexist, but if you really need to know how to do this, ask &
I'll dig out my docs.
DOS rem returns you to DOS
BUG rem brings up the debug program, only commands I remember are
Daddress to dump memory starting at $600
Laddress to disassemble starting at address
X return to the editor
I believe you can also execute code (G?), maybe trace (T?), set
breakpoints & display registers, but the built in debugger is
not my favorite so I seldom use it either. Once again, if you need
this info, ask & I'll find it. I may be thinking of my MAC/65 cart.
OK, now to write a program, I'm sure you're aware of fields. If you
want numbering to be automatic, just type NUM<RETURN>
one space after the line number is the label field, two spaces
is the OP CODE or directive, so to do something like create a

program in page 6 that will set your left margin to zero

```
10 .OPT OBJ
20 RTMARGIN=$52
30 *=$600
40 LDA #0
50 STA RTMARG
60 RTS
70 .END
```

Rick

3811. 1489/75LS189 sio2pc design

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-29 00:00:00 UTC

[2]------3:out 8 o :12 *NC
: 9 : :
(7)------4:in-: out:11 *NC
: \ / :
*NC 5: o :-in:10------[3]
: : \ / :
[9]------6:out o :9 *NC
: : :
(6)&[5]--7: out:8--:<--(3)
: : *DIODE
--------------
*NOTES: If you're positive the cable will never be used with other
peripherals like a 1050, you don't need the diode. If you do use a
diode <recommended> make sure it has a low forward voltage. In the
prototype I tried one with a 1.2V forward drop & it failed to operate,
but a diode with a .65V forward voltage drop worked like gang busters.
This means you can surely get away with any germanium diode & probably
most small signal diodes like the 1N914.
NC means not connected, you don't tie it to anything. Only pins 13 & 14
are tied together. If you feel bad because the thing is too easy, you
can add a few more parts like a .1 Micro Farad disk capacitor between
pins 14 & 7 for decoupling. The funny \ /
o on the 1489 are just an
attempt to show the inverting logic of the 1489. All parts can be had
from your local Radio Shack, but once again, I hate Radio Shack & would
recommend going anywhere else. The SIO pin out when looking at the back
of the Atari is
2 4 6 8 10 12
1 3 5 7 9 11 13
Colors I've found in addition to what Nick Kennedy found
4 & 6 Black & or bare wire. Both of these are grounds, one logic & the
other shield. If you really want to be sure you have a good ground you
can use both of them. Black wire is pretty safe if you're in a hurry &
don't want to bother.
10 +5V Blue in every cable I've seen.
5 DATA OUT It's Green or Dark Green on cables with two green wires.
```

7 COMMAND Violet on some, light green on others.
3 DATA IN & I don't think it comes in any color but orange.
That's it, 5 connections to the Atari serial cable, 4 to the IBM serial cable, 1 chip, 1 diode. The IBM connector will have the numbers on the plastic, but you may need a magnifiying glass to see them. If somebody wants help building a cable, you're better off asking me about this one vs the MAX or 7400 as I'm quite bored with them & this circuit is IMO: The obvious way to go.
Rick

3812. Re: Does anybody use TopDos?

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-29 00:00:00 UTC

Message-ID: <1995Nov29.232346.29526@wariat.UUCP>
Source record: 87357

(TopDOS user asks about SpartaDOS.)
The command line interface is a little convenient. Just type the name
of a .com file to run it, instead of L and the full filename. The
principle advantage is the ease of getting around. You can turn BASIC
on and off with TopDOS, but basic on or off is built in to SpartaDOS.
Also, as far as I know, SpartaDOS is the only DOS that can run, copy,
delete any DOS, not only SPartaDOS, but menu DOSes as well.

Hi Stefan,

das kann gut sein, doch gestern habe ich die Version 1.06s getestet
und manchmal lief die Sache (ich kann nicht sagen warum, es
trat nicht zyklisch auf).
Benutzte ich eine bereits vorhandenes ATR File und formatierte es neu,
lief die ganze Sache. Formatierte ich jedoch eine frisch 'create'te
Diskette, so bekam ich auch immer 0000 Sectors free und beim Schreiben
den Fehler 'Disk voll'.
Aber was anderes, da du aus dem deutschsprachigen Raum kommst, wirst du
doch das BIBODOS und aehnliche Sachen kennen. Solltest du auch eine XF551
haben, welches DOS benutzt du dann fuer den Filetransfer XF551 -> PC ?

Ok, besten Dank und bye

Sven.

3816. FlickerTerm 80

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-29 00:00:00 UTC
From: halliwee@ts436.dyess.af.mil
Message-ID: <30BCD000@syrinx.dyess.af.mil>
Source record: 87361

Well, it's been a long five months since I released FlickerTerm 80 v.0.51, and then promptly dropped out of sight. Spent a few months in Biloxi training to program computers for the Air Force (yes!), then another month bopping around my native Missouri, and now these last few weeks settling into Abilene, TX. Things have certainly been interesting.

Anyway, I'm finally in a position to resume work on Flick. My agenda is still pretty much:
Add a capture buffer
Add a backscroll buffer
Add some protocols (Xmodem ChkSum at least. CRC continues to boggle me)
Augment the macro language

So, in the time since 0.51 was released, has anyone encountered any new bugs/glitches/et al? As always, I welcome all feedback.

ps-- It's good to be back!

WS> anyway; they merely post here.

Yep, that is also the problem for user that use a QWK door to get and
read there usenet (Internet) mail and use a XL/XE with a qwk reader to
read it... Like pabmail, that one has also problems with BIG
messages...

But my probleem is more that they put those BIG aucations in this area
and they don't reader this area.... and also that in those aucations
there are NOT only ATARI systems but also C64 and some other
systems... And for thse computer there are other area....

And than also so people must PAY for every 100 kb or megabyte what
they are getting from the net.... So they have to pay for those
aucations....

WS> Interesting telephone number: +31-(0)-20-6764584
WS>
WS> In North America, your number would be divided into: Country
WS> Code, State Area Code, Metropolitan Exchange, Local Extension ... and
WS> would be read as: +31-(020)-676-4584 ... except that there would
WS> be a '1' in place of the '31'. Just out of curiosity, how is a European
WS> telephone number subdivided ?

Oke I will try it :

+31 = The access code for "The Netherlands".
20 = The area code for "Amsterdam" and some small places around
amsterdam (When you call inside the netherlands it will be 020.
6764584 = Is the number for the BBS line or voice.

WS> I usually see you on the FidoNET....

FIDO net ??? Well that must be about 1 year or so....

Do you also have an AMIGA or PC or some other computer ???

If you like you kan also write me by E-mail or a other network if you
like.....

I have a BJ200e hooked up to my PC clone, and it is one heck of a
printer!! And the price of ~$200.00 can't be beat! I haven't tried it
on my 8-bit though, I still have my old Panasonic 1080i for it. If
someone would like me to try it, I can. I have three printer interfaces
I can try it with, the Supra MP??? (I can't remember the exact number),
a 256K MIO, and an Ape-Face converter.

> recommend?

Although the HPs seem to be more popular, I highly recommend the Canon bubblejets. They're 360 or 720 dpi (vs. HP's 300 or 600), and not as clunky. My bjc4000 is faster (in the still-great-looking "draft" mode) than any non-laser I've seen, and it can also handle color (albeit slowly).
If you really want to do color work, go for the bjc600e or bjc610. If you don't need THAT much speed and can live with no color, the bjc200e seems pretty good too.

> (2) Would DDIII be able to support any of it? I got a lot of good use
> out of my old DDIII + XMM801 setup. I HATED it (slow!), but it still
> looked pretty nice. Is it even worth using DDIII though, with these
> built in fonts on printers? (Although from what I've seen, they aren't
> scalable... DDIII at least has plenty of different sizes.)

I think printer fonts are more trouble than they're worth, but then I've become spoiled by GUIs....

Did I mention that the Canons are epson- and proprinter-compatible out of the box? Your 8bit softwaare should work without having to buy any extra cartridges. One catch, though, is that the printable page size is smaller than most graphics programs expect, but if I remember correctly that's adjustable in DDIII. I haven't tried DDIII with the Canon, but I did try Print Shop and a few others....

> (3) What about color? Would it be worth it? How about writing software
> FOR the printer to print in color, assuming there is none. Any
> experience color jet printer users out here in A8 land?

Color is great if the software is there. The only color-printing Atari software I know of is YEMACYB (which probably wouldn't work with color inkjets), but I'm sure there are programs I don't know about.

You could use Epson LQ-2550 codes to program the Canon BJC printers in color, and I believe HP publishes the info for programming their color printers.

>& (4) What's the best (most reliable -> cheapest) printer interface? I just
> got rid of my only one; then a day later hooked up my aunts printer
> and almost wished I hadn't. :)

I use a P:R: connection I picked up a long time ago, and it's been my
most reliable interface. (I've also had an
MPP-1150 and one whose name I forget but it started with X and had
lots of DIP switches.)

8-bit TOS? As in an 8-bit version of the ST operating system? I've
never heard of that one.

When you FTP files, make sure to set the file type to BINARY before
getting the file. (Just type "bin" at the FTP prompt.) Unix ftp
programs often default to transferring files in ASCII mode, which
corrupts most of them.

3824. Alternate Reality

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-29 00:00:00 UTC
From: brents@bgnet.bgsu.edu
Message-ID: <49gbdp$mil@infoserver.bgsu.edu>
Source record: 87586

(Now doesn't _this_ bring back memories...)

Well, I can fondly spending many a night as a young preteen agonizing over this game... so seeing this newsgroup, I thought I'd look for anybody else who shared my old addiction for the greatest games ever put out for the ole Atari 8-bit platform: namely, Alternate Reality: The City, and Alternate Reality: The Dungeon. I might hope beyond hope that there's an archive of AR stuff somebody's got (my old maps and potion lists are looong gone, sniff), or that anybody out there ever figured out some of the stuff I never did (what the hell was the answer to the Gargoyle's rhyme, anyway? :), you get the picture. I would be very very glad to chat over email with old AR vets, so please gimme a yell at brents@bgnet.bgsu.edu (this goes quintuple if you're Phillip Price. :)

Danke,
-brent

Getting into umich, and getting anything posted there takes so
long that ive decided to make APE available on this machine by WWW.

To get 1.07, point your browser to http://www.nacs.net/~classics/ape107d.zip

To get the 'newest' version in the future, there should be a pointer
to it at http://www.nacs.net/~classics/

Thanks everyone!

Well, the main problem with running most of these (like Fractalus and
AR) is getting past the copy protection on the diskette to make a
working disk image. So if you have done that, the image should work
on Xformer as well as Rainbow?

Send it my way and I'll tell you. I own AR the City.

I find the defrag pgm quite interesting... I have a suggestion.

What would the usefulness be of a Disk Caching program? Especially for
the people with HD's.. Optional WriteBehind Caching as well.
It should be very doable, since there is lots of ramdisk software src
code available, and people can make drive drivers no problem.
Good idea, or has it been done/asked before?

GEM is a pretty simple type of OS 'GUI'... it could be done fairly well
I imagine. It would need a way to store programs in swap-ram though for
it to be usable at all.

Don't anyone forget about a LightPen! It could sound old, and useless,
since they haven't been used for years, but they are having some comeback
as they are helpful. And more natural for some. A properly built lightpen
can be quite accurate too, so if someone has had bad experiences with a
lightpen being inaccurate, I'd say that it doesn't have to be.
Just use a Shadow register for the lightpen coords, and away ya go!

AUCTION # 6: Atari 2600 Cart Auction/Part 3 (Aprox 100 carts)
NOTE: These 3/2600 auctions each contain their own
unique variety of cartridges. The first
and second auctions contain common and
uncommon cartridges, while the third
auction contains mostly rare cartridges.
AUCTION # 7: Atari 2600 Special Systems Auction
AUCTION # 8: Atari 800, Atari ST, C64, and IBM disk software
AUCTION # 9: C64/ODY/TI99/TRS80/VIC20 Cartridge Auction
AUCTION #10: C64/ODY/TI99/TRS80/VIC20 Systems Auction
AUCTION #11: Misc Leftover Auction (A little bit of everything, and more)
#
NOTE: Most of the future auctions listed above will start in '96. The
```

exact date of each auction will depend on how much time I have
and how long it takes me to gather data for that auction.
#
@ = Auction is Finished --- * = Auction in progress
~~~~~~
#
WHY ALL THE AUCTIONS:

It's time for me to clean house. I am selling just about everything I
own pertaining to old game and computer systems, cartridges, software,
and other items for which I am hard pressed to find any more storage
for. I have far too many items to sell in one Auction. Therefore, I
have broken it up into several Auctions (11 in all, so far) as I've
shown above. The last Auction will have basically everything that I
couldn't catagorize that are leftover. I hope these Auctions will
help you in your collecting endeavors. Have fun!
#
#
TRADES OR BULK SALES:

I am NOT really interested in any TRADES or BULK SALES, unless they
are very beneficial to me, since my objective for these Auctions is
to get extra cash. However, I will entertain any trade deal that you
wish to come up with, but be warned, it will have to be a very
attractive deal for me to accept it. I will, of course, notify the
current bidder affected by any deals that I might make, and allow
the bidder(s) a chance to make a comparable offer. However, as I
said, the chance of an offer being accepted is very small.
#
#
PLEASE READ THE FOLLOWING AUCTION RULES:

I have added the following rules and comments both for your protection
and mine. Please read through them carefully as this will save us all
some time in the long run. These rules should remain stable through
any of my future auctions, also. If a rule is revised, I will flag
it with a double asterisk (**) in the first two columns of the first
line, for that auction only.
#
**************************** START OF RULES ****************************
#
o This auction starts on Saturday, November 18th at 8:00pm and
ends on Monday, December 4, 1995 at 8:00pm.
#
o All cartridges and/or items that have NOT been BID on WITHIN
24-HOURS of the deadline, will be CLOSED and all the winners
will be notified by email.
#
o All cartridges and/or items that HAVE had a BID placed on them
WITHIN 24-HOURS of the deadline, will REMAIN OPEN and the
~~~~~~

Auction will continue using the 24-hour rule. This rule simply
means that if the cartridge and/or item being bid on does not
have another bid on it within 24-hours, then that item is closed
and the winner is notified by email. Otherwise, the cartridge
and/or item remains open for another 24-hours. This continues
until all cartridges and/or items are closed.
#
o Minimum bid settings are shown in BID column until a BID NAME other
than "NOBIDDER" is shown in the Bidder column (last column). I
will not accept any bids that do not meet the minimum bid listed.
#
o Minimum bid increments are as follows:
$0.25 - $0.99 = $0.25 Increment
$1.00 - $9.99 = $1.00 Increment
$10.00 and up = $2.00 Increment
#
o First time bidders are required to give their full name and address
of where they want their cartridges and/or items shipped to.
Remember, this only applies to the first time (per auction) that
you place a bid in that auction. I will verify all addresses with
each winner before shipping out any cartridges and/or items.
#
o First time bidders will need to also send me an alias name of up to
8-characters. This name will be used for any bids that you will be
sending in during the course of this auction. This may be your real
name or a made-up one, depending on if you wish to remain anonymous
or not. If I do not receive one, I will make one up starting with
"Bidder00" and incrementing through to "Bidder99".
#
o If you BID, you are expected to BUY!!! Of course, I cannot enforce
this, so to be fair, I will allow up to three (3) cancellations
by the same bidder during the course of all my upcoming auctions
shown above (prior to the rules), and provided they are cancelled
within 24-hours of the original bid. If you cancel for a fourth
time or if you cancel after 24-hours anytime, you will be barred
from bidding in any future auctions that come up. In other words,
3-STRIKES AND YOUR OUT!!!
#
NOTE: If someone cancels a bid, that bid will be removed and the
previous bidders bid and bidder name will be entered in
lieu of, and email will be sent notifying that bidder of
the change.
#
o New updates will be received by all bidders every 24-48 hours
(I will try to keep it within 24-hours as much as I can). I
will also try to keep an updated posting in the following
usenet area - "rec.games.video.classics" and "comp.sys.atari.8bit",
whenever possible.
#
o Shipping cost will depend on the how many cartridges you buy:

1 Cartridge = $2.00 Total
2-6 Cartridges = $0.50 per Cartridge extra ($2.50 to $4.50)
7-15 Cartridges = $5.00 Total
16-49 Cartridges = $7.00 Total
50 & UP Cartridges = $9.00 Total
#
NON-Cart Item (10lbs & under) = $7.00
NON-Cart Item (over 10lbs) = Shipping Wgt x .40 (Aproximately)
(This will be more accurately defined once everything is closed
and a weight and destination can be determined)
#
NOTE: All shipping will be done US Parcel post or UPS, depending
on your choice. Please let me know ahead of time if you
have a preference. Otherwise, I will ship US Parcel Post
for all cartridges and/or items totalling $5.00 or less
in shipping and UPS if the total shipping is over $5.00.
#
o I will accept payment either by check or money order only. If by
check, I will wait 5-7 days for it to clear before mailing any of
the cartridges and/or items. If by money order, the cartridges
and/or items will be mailed within 24-48 hours of having received it.
#
o All cartridges are sold as is. Most have been previously tested,
but not all (mainly because I believe that most cartridges will
work). However, I will test each cartridge on my system before
shipping it out. This way, when you receive your cartridges and/or
items, you know they are working properly. If I have a problem
with a cartridge, I will notify you and you will be compensated
to suit.
#
o Whenever an asterisk is shown to the left of the cartridge name,
it means that the instructions for that cartridge is available,
and will be included in whatever bid you make.
#
o I reserve the right to pull or refuse to sell any cartridge from
this auction for the following reasons only:
1 - The Cartridge and/or item has not met its minimum bid
settings and has not been bid on by the halfway point.
2 - There is an offer on the side for a cartridge and/or item,
that is acceptable to me.
#
o The information listed with each cartridge is to my knowledge,
accurate. However, I am not responsible for any mistakes and/or
errors that I may have overlooked. If I find any mistake on
any of the cartridge information, I will send the correction
along in the next update to all bidders.
#
****************************** END OF RULES ******************************
#
#

Cartridge Maker Codes (These may be revised depending on the auction):
AT = Atari AV = Activision BB = Broderbund
BF = Big Five EP = Epyx IM = Imagic
LT = Lightning MW = Midway PB = Parker Bro's
RK = Rokian SI = Sierra SY = Synapse
TE = Thorne Emi
#
Cartridge Types (These may be revised depending on the auction):
TL = Text Label only.
PL = Picture Label.
#
Cartridge Conditions:
VG = Label has heavy signs of wear and tear. There may be tears,
peeling offs, and/or scratches. The label is mostly
readable, but some parts of it may not be.
F = Label is completely readable. May show some signs of minor
wear and tear, such as scratches. Screw holes may also be
evident (see Comments).
VF = Label has very slight wear and tear. There may be some very
slight discolorings. The label is clear and should not have
any major defects marring the readability it. However, there
may be an End Label Missing, Screw Hole(s), etc which should
not affect its readability and clarity.
NM = Near perfect label. May show very slight wear. No defects.
M = This is a new cartridge and label or is just like new.
#
Defect Codes (These may be revised depending on the auction):
LP = Label Peeling.
LW = Label is Wrinkled.
SSL = Small Scratch(es) on Label.
#
Comment Codes (These may be revised depending on the auction):
XE = 130XE compatible system cartridge
OEC = Open End Cartridge (Mostly Non-Atari)
ITMS = includes Temparature Module, sensor, etc (COMPLETE)
ILSAS = Includes Light sensor, assembly, stand, etc (COMPLETE)
J#### or R ### # = Number Stenciled on Cartridges (Atari only)
(I don't know what this number represents.)
#
Duplicate Cartridge Comments:
o All duplicate cartridge names listed have been added because
they have subtle differences among them. Examples of some of
the differences found would be:
1 - Numbers stenciled on cartridge.
2 - Color of cartridges (Not the label).
3 - Country where cartridge came from (Mostly MN carts).
4 - Picture vs Text Label.
5 - Year cartridge was released.
6 - Maker of cartridge.
#

When a duplicate cartridge is listed, I have listed each
cartridge separately along with its maker in alphabetical order.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
LOOK FOR OTHER GREAT FUTURE AUCTIONS by LEFTY
--------------------------------------------------------------------------
AUCTION # 1: *Atari-400/800/600XL/800XL/130XE Cartridge Auction
AUCTION # 2: Atari 5200/7800 Cartridge Auction
AUCTION # 3: Atari 800/5200/800 Systems Auction
AUCTION # 4: Atari 2600 Cart Auction/Part 1 (Aprox 100 carts)
AUCTION # 5: Atari 2600 Cart Auction/Part 2 (Aprox 100 carts)
AUCTION # 6: Atari 2600 Cart Auction/Part 3 (Aprox 100 carts)
NOTE: These 3/2600 auctions each contain their own
unique variety of cartridges. The first
and second auctions contain common and
uncommon cartridges, while the third
auction contains mostly rare cartridges.
AUCTION # 7: Atari 2600 Special Systems Auction
AUCTION # 8: Atari 800, Atari ST, C64, and IBM disk software
AUCTION # 9: C64/ODY/TI99/TRS80/VIC20 Cartridge Auction
AUCTION #10: C64/ODY/TI99/TRS80/VIC20 Systems Auction
AUCTION #11: Misc Leftover Auction (A little bit of everything, and more)
#
NOTE: Most of the future auctions listed above will start in '96. The
```

exact date of each auction will depend on how much time I have
and how long it takes me to gather data for that auction.
#
@ = Auction is Finished --- * = Auction in progress
~~~~~~
#
WHY ALL THE AUCTIONS:

It's time for me to clean house. I am selling just about everything I
own pertaining to old game and computer systems, cartridges, software,
and other items for which I am hard pressed to find any more storage
for. I have far too many items to sell in one Auction. Therefore, I
have broken it up into several Auctions (11 in all, so far) as I've
shown above. The last Auction will have basically everything that I
couldn't catagorize that are leftover. I hope these Auctions will
help you in your collecting endeavors. Have fun!
#
#
TRADES OR BULK SALES:

I am NOT really interested in any TRADES or BULK SALES, unless they
are very beneficial to me, since my objective for these Auctions is
to get extra cash. However, I will entertain any trade deal that you
wish to come up with, but be warned, it will have to be a very
attractive deal for me to accept it. I will, of course, notify the
current bidder affected by any deals that I might make, and allow
the bidder(s) a chance to make a comparable offer. However, as I
said, the chance of an offer being accepted is very small.
#
#
PLEASE READ THE FOLLOWING AUCTION RULES:

I have added the following rules and comments both for your protection
and mine. Please read through them carefully as this will save us all
some time in the long run. These rules should remain stable through
any of my future auctions, also. If a rule is revised, I will flag
it with a double asterisk (**) in the first two columns of the first
line, for that auction only.
#
**************************** START OF RULES ****************************
#
o This auction starts on Saturday, November 18th at 8:00pm and
ends on Monday, December 4, 1995 at 8:00pm.
#
o All cartridges and/or items that have NOT been BID on WITHIN
24-HOURS of the deadline, will be CLOSED and all the winners
will be notified by email.
#
o All cartridges and/or items that HAVE had a BID placed on them
WITHIN 24-HOURS of the deadline, will REMAIN OPEN and the
~~~~~~

Auction will continue using the 24-hour rule. This rule simply
means that if the cartridge and/or item being bid on does not
have another bid on it within 24-hours, then that item is closed
and the winner is notified by email. Otherwise, the cartridge
and/or item remains open for another 24-hours. This continues
until all cartridges and/or items are closed.
#
o Minimum bid settings are shown in BID column until a BID NAME other
than "NOBIDDER" is shown in the Bidder column (last column). I
will not accept any bids that do not meet the minimum bid listed.
#
o Minimum bid increments are as follows:
$0.25 - $0.99 = $0.25 Increment
$1.00 - $9.99 = $1.00 Increment
$10.00 and up = $2.00 Increment
#
o First time bidders are required to give their full name and address
of where they want their cartridges and/or items shipped to.
Remember, this only applies to the first time (per auction) that
you place a bid in that auction. I will verify all addresses with
each winner before shipping out any cartridges and/or items.
#
o First time bidders will need to also send me an alias name of up to
8-characters. This name will be used for any bids that you will be
sending in during the course of this auction. This may be your real
name or a made-up one, depending on if you wish to remain anonymous
or not. If I do not receive one, I will make one up starting with
"Bidder00" and incrementing through to "Bidder99".
#
o If you BID, you are expected to BUY!!! Of course, I cannot enforce
this, so to be fair, I will allow up to three (3) cancellations
by the same bidder during the course of all my upcoming auctions
shown above (prior to the rules), and provided they are cancelled
within 24-hours of the original bid. If you cancel for a fourth
time or if you cancel after 24-hours anytime, you will be barred
from bidding in any future auctions that come up. In other words,
3-STRIKES AND YOUR OUT!!!
#
NOTE: If someone cancels a bid, that bid will be removed and the
previous bidders bid and bidder name will be entered in
lieu of, and email will be sent notifying that bidder of
the change.
#
o New updates will be received by all bidders every 24-48 hours
(I will try to keep it within 24-hours as much as I can). I
will also try to keep an updated posting in the following
usenet area - "rec.games.video.classics" and "comp.sys.atari.8bit",
whenever possible.
#
o Shipping cost will depend on the how many cartridges you buy:

1 Cartridge = $2.00 Total
2-6 Cartridges = $0.50 per Cartridge extra ($2.50 to $4.50)
7-15 Cartridges = $5.00 Total
16-49 Cartridges = $7.00 Total
50 & UP Cartridges = $9.00 Total
#
NON-Cart Item (10lbs & under) = $7.00
NON-Cart Item (over 10lbs) = Shipping Wgt x .40 (Aproximately)
(This will be more accurately defined once everything is closed
and a weight and destination can be determined)
#
NOTE: All shipping will be done US Parcel post or UPS, depending
on your choice. Please let me know ahead of time if you
have a preference. Otherwise, I will ship US Parcel Post
for all cartridges and/or items totalling $5.00 or less
in shipping and UPS if the total shipping is over $5.00.
#
o I will accept payment either by check or money order only. If by
check, I will wait 5-7 days for it to clear before mailing any of
the cartridges and/or items. If by money order, the cartridges
and/or items will be mailed within 24-48 hours of having received it.
#
o All cartridges are sold as is. Most have been previously tested,
but not all (mainly because I believe that most cartridges will
work). However, I will test each cartridge on my system before
shipping it out. This way, when you receive your cartridges and/or
items, you know they are working properly. If I have a problem
with a cartridge, I will notify you and you will be compensated
to suit.
#
o Whenever an asterisk is shown to the left of the cartridge name,
it means that the instructions for that cartridge is available,
and will be included in whatever bid you make.
#
o I reserve the right to pull or refuse to sell any cartridge from
this auction for the following reasons only:
1 - The Cartridge and/or item has not met its minimum bid
settings and has not been bid on by the halfway point.
2 - There is an offer on the side for a cartridge and/or item,
that is acceptable to me.
#
o The information listed with each cartridge is to my knowledge,
accurate. However, I am not responsible for any mistakes and/or
errors that I may have overlooked. If I find any mistake on
any of the cartridge information, I will send the correction
along in the next update to all bidders.
#
****************************** END OF RULES ******************************
#
#

Cartridge Maker Codes (These may be revised depending on the auction):
AT = Atari AV = Activision BB = Broderbund
BF = Big Five EP = Epyx IM = Imagic
LT = Lightning MW = Midway PB = Parker Bro's
RK = Rokian SI = Sierra SY = Synapse
TE = Thorne Emi
#
Cartridge Types (These may be revised depending on the auction):
TL = Text Label only.
PL = Picture Label.
#
Cartridge Conditions:
VG = Label has heavy signs of wear and tear. There may be tears,
peeling offs, and/or scratches. The label is mostly
readable, but some parts of it may not be.
F = Label is completely readable. May show some signs of minor
wear and tear, such as scratches. Screw holes may also be
evident (see Comments).
VF = Label has very slight wear and tear. There may be some very
slight discolorings. The label is clear and should not have
any major defects marring the readability it. However, there
may be an End Label Missing, Screw Hole(s), etc which should
not affect its readability and clarity.

>people who are complaining about things that are not working right in
>SIO2PC, do not write it down in a simple letter to Nick Kennedy himself.

Don't get things wrong here: I wasn't complaining, I was ASKING. That's
what is newsgroup is there for. And it's true APE 1.04 runs fine on my
machine.
If SIO2PC 4.04 is still shareware, why don't you post it here?

Ahh, I assumed you were using the command-line FTP program. With
netscape it should work as long as you don't save as text. Maybe
there was a problem downloading from unix....

3844. Does anybody use TopDos?

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-30 00:00:00 UTC
From: kdegroff@rainbow.rmii.com
Message-ID: <49j3na$qg3@natasha.rmii.com>
Source record: 87366

The contributors to the newsgroup here generally seem to prefer Spartados or Mydos. What is the big advantage with Spartados? I tried it several years back and managed to wipe out some files by forgetting to leave the comma out when copying files. I have had very few problems using Topdos and it seems to be compatible with most programs. It is very user friendly with a nice menu/status display which tells you at a glance what your current configuration is. It allows the use of up to 65535 sectors for disk access. There is a nice command file system (a little limited, but very useful). There is a good help file system also. The ramdisk management is excellent IMO. It supports Happy and "Wise" density switching for floppies. I use it with a 320K 130XE and 360k XF551 plus some double density 1050s. Admittedly, I have not tried it with larger memory or floppies but have no reason to think that it will not work (as advertised). It has some neat features built-in such as disk RPM checking, a file comparison capability, the ability to read, modify and write sectors, memory modification, etc. It works fine with Turbo Basic XL and does not use ram under the OS but still leaves about the same amount of free memory as the old DOS II. The version I mainly use is TopDos Professional. Anyway, I would be interested in hearing from anyone out there who can tell me the advantages of Spartados. I would rather be in the mainstream if I don't have to give up the convenience of TopDos and the relatively seamless integration of disparate programs that I have been able to accomplish with it.

3845. Announce: Atari '81 commercials on WWW

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-30 00:00:00 UTC
From: aramos@cis.ohio-state.edu
Message-ID: <49kkurlNN5kn@boa.cis.ohio-state.edu>
Source record: 87367

Hello, fellow Atari fans...

While unpacking my video collection after the last move, I found a tape I had borrowed from my previous job. It was a TV special dating from 1981 about the 'computer revolution'. I popped it in and grooved on a time-warp back to the feathered-back, parted-in-the-middle days of my early 80's youth.

Anyway, the kicker is that this special was sponsored by Atari, and so it features what must have been their entire television promotional campaign. The Atari 2600 and 8-bit computers are shown off nicely!

All six commercials, captured as QuickTime movies, are available via the World Wide Web. They're ~3MB in size on average; sorry but that's the smallest I could make them.

They are referenced on the "BRiTiSH Underground Atari 8-bit Page" at

http://nimitz.mcs.kent.edu/~clisowsk/8bit.html

Ironically, it's a U.S. site; the movies will soon have a European home at Ivo van Poorten's "Atari Home Page".

Grin and groan; I did!

Depends on your definition of compatible... If I remember the ST mouse uses
both trig(0) and trig(1) for its mouse buttons. So as long as you don't mind
sacrificing 50% of your button input capability, you can be fine.

Though the above is 'configured' for the ST's...

But I could be, wrong, I'll need to check...

(SNIP, TopDOS abillities)

>>>
SpartaDOS has everything you mentioned and more, without a MENU.
I guess the main reason I went to it was when I got my MIO back in ?? 1988??
I had to have it to use the MIO and the 20Meg Hard Disk connected to it. Not
sorry about it and I went with SpartaDOS X as soon as it was available. SDX is
Cart. based so you have even more RAM available and can be configured NOT
to use OS RAM (if you have a 130XE or Expanded 8Bit). I happen to have a
modified version of AtariWriter Plus that runs from my Hard Drive and you can
RESET out of it back to DOS. Also a modified version of ComputerEYES that
runs off the Hard Drive and can handle all 9 Devices, Single or Double Density.
Neither of these programs will work with MYDOS or TopDOS from my Hard Drive.

From: jeking@xmission.com
Message-ID: <49l06p$uu@news.xmission.com>
Source record: 87373

I know I have a couple of .DCM files that consist of an InfoCom game that was converted into ONE .DCM, even though the original game consisted of two disks.

How is this possible?

I've just recently purchased ALL of the InfoCom games, and now wish to put them each on a 720k hard disk partition, but since almost all of the original Infocom games are 1 disk (side 1 and two), I'm not sure how I can accomplish this.

Any help greatly appreciated.

I've heard a lot about the SIO2PC cable in the last couple of years, but I have never been ambitious enough to really get my 8bit up and running again. Most of what I've heard has been pretty good, and I'd really be interested in obtaining one of these devices.

However, getting the parts has been a little difficult, and I'm not much of a solderer, so I was wondering if there were any alternatives...

Anyone want to sell a working SIO2PC cable? Or do you know of some other way I might obtain one? E-mail if interested... Thanks.

Although the language approach is more flexible, I'm sure many people
would be happy with the simpler approach. Then work on adding the
macro language on top of that.

TopDos Professional, by Richard K. Bennett, is more fully-featured than TopDos 1.5 Plus and includes subdirectories among other things. Both versions will do things like sort directories, undelete files. 130XE ram is also supported along with ramdisks, if you want it. Configurability is a strong point.

r >PPP.
r > Just wondering, Rich Mier

I've found somebody who let's me use his system for free. That means I have access to usenet groups (he doesn't "carry" all, but if I ask nicely, he'll add an extra group) and Email. For free. But... He only seems to have one modem, which he has to unplug from something and plug it into the phoneline whenever I call. If he aint home, or in bed, or lazy, I don't get to pick up or leave any messages. Because my XE doesn't understand all those nice control characters used in stuff like ANSI, etc. I have to use QWK, to up and download my mail. QWK also was easier to learn then his unix system.

End since he lives in Amsterdam and I live in Heerlen (close to the moste southern point of the Netherlands, Europe), my calls are long distance.

I read: comp.sys.atari.8bit, rec.autos.marketplace and the offroad list (my provider wrote me a special utility, that will cut the long Digests (read: a lot of messages bundled and send out at once. As one big message.) into lots of messages.) It takes me about 20 minutes to up- and download my QWK packages (using a 130XE (BobTerm and Z.COM in RAMdisk), BlackBox (with spooler, so I can dump the "posting to..." stuff to printer instead of disk) and a SupraFaxModem V.32bis at 19k2.

At the moment I'm hoping Bob Puff will rewrite the BB RS232 drivers, so Erhard Puetz can start on the hardware to bring the 6551 on the BB up to 57k6

BTW it takes me hours to read through all the messages. Compare that to the 20 minutes or so I need to download (every 2 to 3 weeks) and you understand why I do as much as possible OFF-LINE. And I can read my mail whenever I want, plus I always have it on disk (untill I've read it, then it's deleted)

Stupid thing about PabQWK is, you can't use it if it doesn't find message files , so if I want to send somebody a message (as in Not-a- reply), I either have to do it ON-line, or have a message file on disk.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS When calling BBS's I use my capture buffer. Then prepare my answers off-line. Because A) getting distracted while on-line increases the time I spend on-line B) their are no Atari BBS's local to me

Believe me, it might look like a hassle to do "everything" off-line, but it decreases your on-line time quite a bit, and the phone bill accordingly.

After rereading what you said above I might add; I always have to pay per "click". The time between "clicks" varies depending on local or long distance or international (depends on country you are calling to.) and daytime/nighttime . In the weekend, nighttime is charged on all services. Calling voice or modem doesn't make a difference (cost wise that is).

r >Subject: New Issue of Atari Classics
r >Date: Sat, 4 Nov 95 16:15:47 -0500
r >
r >Say, an article which has been completely written, but which
r >must be spread across two or three issues.

I've sent him a whole bunch of stuff (mainly hardware articles) that were once printed in a Dutch magazin. It can be re-published, the original autor/designer gave his permission. I don't know much about how hardware and software is put together, but I do know that there are a lot of good stories in that package. If Bob doesn't use it, than that's his fault and our loss.

BTW I always like the articles by Mike Jewison, Jeff McWilliams and even Ben Poehlands own hardware stories. Hope they will be back soon...

If I had a wife and kids and not much of an income, AC would be one of the first to go. Really sorry I have to say that, but that's the way I feel about AC at the moment. I know that AC had more than it's fair share of bad luck, and I thank the guys for doing the job. I REALLY hope quality goes up.

> let me know...
> -- Kid

How much are you willing to pay for the above items. I have quite a bit
of 8 bit stuff in my closets and might be willing to part with it if the
price is right. I have an APE FACE printer interface and also a PR
Connection. I don't know if I should keep them or not...make an offer.

AMERICAN TECHNA-VISION HAS A HUGE INVENTORY OF NEW 8-BIT SOFTWARE,
BOOKS AND REPLACEMENT PARTS FOR YOUR SYSTEM. EXAMPLES:

13 PIN SERIAL I/O CABLE 3 FT . . . $1.50 EA. OR (10) FOR $10.00
9VAC POWER PACK FOR 1050 / 800 / 400 / 1200XL / XF551 / 850 . . . $4.00
MICROPRINT PRINTER INTERFACE ALLOWS YOU TO CONNECT ANY STANDARD
PARALLEL PRINTER TO YOUR SYSTEM . . . . ONLY $14.50
XL/XE REPLACEMENT POWER SUPPLY . . . $9.95
CRIMEBUSTERS CARTRIDGE (REQUIRES LIGHTGUN) . . $5.00
VIDEO TITLESHOP (GRAPHICS DESIGN) . . . $5.00
BLUE MAX CARTRIDGE . . . $5.00
JOUST CARTRIDGE . . . $5.00
PAC-MAN CARTRIDGE . . $2.50
DONKEY KONG CART. . . $2.50

HUNDREDS OF OTHER ITEMS. TO RECEIVE YOUR FREE CATALOG, PLEASE PROVIDE
US WITH YOUR NAME AND STREET ADDRESS. TO REQUEST A CATALOG BY PHONE,
CALL OUR SALES OFFICE AT 510-352-3787. FAX US AT 510-352-9227.

GO ATARI!!

3868. XEP80 part 1

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-30 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <49l023$4gr@link.xs4all.nl>
Source record: 87390

[Continued from last message]
So we take an EPROM, in which we place the new XEP 80 driver, a bit of electronics to decode some signals, a 6551 and a triple DIP switch. The DIP switch is used to select a device number (Mathy: Hmm, nice idea! Where have I heard that one before :-)) and connect the whole thing to the parallel bus of the XL/XE. For the electrical engineers among you I have to add that the XL/XE first of all needs a couple of powerfull bus drivers in the shape of two 74AS244 and one 74AS245, especially if you're running a BlackBox!

The memory map of the driver:

The driver for the XEP 80 basically exists of two parts. One of those parts is a so called Relocator, meaning, it moves the main programme to the top of the memory.
Now I've recently worked with TurboWord+ und while reading the manual, I bumped into something strange. The driver of the XEP 80 should be called AUTORUN.SYS under TurboWord+ and SpartaDOS, because otherwise the MEMHI would be too low. Read it, tried it, seen it. But why? With AUTORUN.SYS, MEMHI is set at $95FF, when run by hand with XEP80 (RETURN) or from a batch file, it's set at $8FFF. I accepted it for a long time, but since it kept bugging me, I checked into this. I'm not gonna tell you how. But what came out will knock you off your socks. When run by hand, the driver will install itself twice. But only the last one installed will be used. And it installs itself twice, because the file XEP80 ends with an INIT address, instead of a RUN address. DOS jumps to the INIT address ($2E2) after loading the file and when returning, tries to jump to the RUN address. But since there is none, it jumps to the beginnign of the file, which starts the relocator once again. Using a disk monitor, I changed INIT to RUN and that was it. I was rewarded with 1.5 kByte more free memory.

RESET

One thing you can not do is press RESET or otherwise cause a warm start. A warm start will reinitialise the device drivers, including the XEP 80 driver. One would think that all values are entered again, but the value for MEMHI is NOT entered. Sigh, those programmers at ATARI, real pro's. But even they can forget some things. However, after a warm start, MEMHi is set to the start of the display list. With BASIC this is $9C1F. If you now fill up the memory nicely, you'll eventually overwrite the XEP driver, which is located between $9600 and $9C1F. If at this point you press RESET again, not even DOS will be reinitialised and you will be unable to save anything. And that's by far not all. Small error, big results.

Well, that's about all I want to say about the XEP 80 for now, but the text is over 10 kByte anyhow. Maybe it's even usefull to somebody. I'm always happy to get an echo.

Greetings, your
Floppydoc
Erhard
Puetz

_____@

Erhard Puetz is the floppy repair guy of the ABBUC. He can be reached via there snailmail address: ABBUCev, Wieschenbeck 45, D-45699 Herten, Germany, or via IAN or USF-net under the name Atreju.

He also developed the HDI interface.

3869. XEP80 part 2

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-30 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <49l023$4gt@link.xs4all.nl>
Source record: 87391

This is the second article about the XEP 80. It was originally written by Erhard Puetz a.k.a. Atreju and published in ABBUC magazine number 39, which was sent out to ABBUC members just before Christmas 1994.

Erhard gave me (Mathy Van Nisselroy) permission to translate the articles about the XEP 80. Please remember that neither English nor German is my mother language.

BTW the coils I (make that; Erhard) talked about in the previous article are called deflection coils in English.

On with the article....

--

The XEP 80 part two

When I said in my previous article that I would be please about an echo, I meant, I would be pleased with ANY echo, not ONE echo. But I shouldn't complain, better ONE echo then NO echo at all.
The echo said to me: Erhard, after I read you article about the XEP 80 in the ABBUC magazine (Mathy: number 38), I pulled my XEP 80 outof the drawer. I've always wanted to use it with BobTerm, but since the XEP driver for BobTerm doesn't switch the XEP to the German (Mathy: ahem, I thought it was called the European or PAL) standard, I've always had a flickering, too small image. Can't we do something about that?
Sure, I say, one takes the XIO command that sets the XEP 80 to the 50 Hz standard, turns that into a small machine language program and loads it as AUTORUN.SYS before BobTerm - Just a moment, this aint gonna work this way. There is no XEP driver initialised yet, making the XIO command disappear into thin air. OK, first the XEP driver, then the XIO command, then BobTerm... Hmmm, won't work either. The XEP driver for BobTerm isn't hooked to the normal editor. And, BobTerm loads and initializes the driver. - Think, Think, Think - The driver contains the subroutine for sending data to the XEP. That's the part we talked about in the previous article (Mathy: ABBUC magazine 38). Here is the address data for the driver: memory from $4000 to $422E and RUN $4001. Ah yes, this should work. At the end of the files, before the RUN address, I append a small routine and redirect the RUN address to it.

This is what that looks like:

```
$422F SEC ; A command is send
$4230 LDA #$D7 ; the number $D7 sets the XEP to 50 Hz in
```

```
textmode
$4232 JSR $4145 ; That's the point where the Send-routine
starts
$4235 JMP $4001 ; driver installed
.ORG $02E0 ; RUN vector
.WORD $422F ; RUN address
```

Try it, it works. During all these try outs, I've searched through the XEP driver several times, and that's when I saw that the Send-routine starts a bit earlier than I told you last month. It starts like this:

```
$4139 X_DAT CLC ; Data will be send
$413A .BYTE
$413B X_DAT SEC ; A command is send
$413C PHP ; Get Carry status
$413D WAIT_3 LDX VCOUNT ; Number of just created image divided by
two
$4140 CPX #$6B ; Equal or greater than 107
$4142 BCS WAIT_3 ; Yes, then wait
$4144 PLP ; return Carry Status
$4145 ROR ; shift byte to the right until
$4146 ROR ; bit 0 is send first.
$4147 ROR
$4148 ROR
$4149 ROR
```

... And this is where the part from the article in magazine 38 continues.
What do my square eyes see there? An other waiting loop? What's that suppose to do? Well, boldly said, it's not allowed to send data during the Vertical Blank. But it's not clear to me why. The VBI is disabled anyhow. Might the WSYNC register in the "austastluecke" (Mathy: some kind of interval. Maybe I'll know what this word means when I translate the next article about the XEP, should Erhard write more of them. :-)) not deliver the apropriate timing? Let's try that. Starting with $413D I'll just write the NOP command 7 times. We're still losing time, but at least we're not waiting 50 times a second. So, loaded BobTerm with the changed driver and - Look at that. All of a sudden BobTerm works with the XEP 80 at 9600 baud, not just 4800. I've tried it out a bit more, but could find any negative side effects. So I called the ABBUC BBS and looky here, works like a charm. With my chest raised in pride I called the ABBUCcian that had laid this task upon me. I've doen it, I've done it, I said, not just the 50 Hz, but even 9600 baud.

The day before yesterday was the day that I decided to show off my newly gained knowledge in ABBUC magazine. So I called Wolfgang (Mathy: Wolfgang Burger is the president of ABBUC and previous SysOp of the ABBUC BBS) to ask him, if he would in interested in a sequel to the XEP 80 article. Sure, he said, opening up the way to help the

ever information hungry ABBUCcians. And here's a little extra, just to make sure you don't starve. For $40E0 on, we have 13 bytes, with which the XEP is initialized:

$D9 Cursor always on
$D4 Use ATASCII characterset
$DE Bright characters on dark background
$D3 Burst mode, no cursor data is send back
$60 Left Margin 0 low nibble
$70 Left Margin 0 Hi nibble
$AF Right Margin low nibble 15 + 4*16 Hi nibble = 79
$B4 Right Margin hi nibble
$00 Horizontal cursor position = 0
$80 vertical cursor position = 0
$D0 Erase List flag
$C5 Fill RAM with SPACE-characters
$DC Set Scroll window to X-cursor position

Since all this trail and error stuff started to annoy me, I "just for a minute" reassembled the driver, so I now have a fairly readable file to work with. This means I'm gonna write more articles about the XEP 80. Since I was able to delve up more information about the XEP 80, I can already tell you: the 19200 baud are in reachable distance and I seem to be on a hot trail with my suspiciouns about the 6551 SIO chip from the first article (I think).

DEEPER DUNGEONS

The videocontroller inside the XEP 80 is a 48 pin chip. It's data bus is 16 bits wide on the video side. This way, two RAMs could be read simultaniously, one containing the text that should be displayed and another containing the text attributes. There are eight possible attributes:

Inverse : A character plus it's surrounding area is display "Inverse"

Halve Bright : The character in displayed with a lower brightness. Other options are a higher brightness and even color.
Flickering : On, Off, On, Off
Double Height : Text in double height, internally some conditions have to be met though.
Double Width : Text in double wide. The next line can't be displayed though, so we have to leave a blank line between two lines of characters.
Underlined : An apparently freely defined character is mixed in. This can be the "underline" character or an "overline" or "strait through the middle" character or whatever you want.
Hidden : The text is not displayed at all. This attribute should also be set when using a double height character, so the controller knows that this is the bottom halve of the double height character.

[Continued...]
---
* PabQwk 2.0 *

3870. XEP80 part 2

Newsgroup: comp.sys.atari.8bit
Date: 1995-11-30 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <49l023$4gv@link.xs4all.nl>
Source record: 87392

[Continued from last message]
Graphics : Since this is an attribute, text and blockgraphics can be mixed at will. Except double height, all other attributes can be used at the same time.

And then there is the Graphics mode of the XEP 80. Just like the subject of block graphics, it's a very broad subject and will not be discussed here.

THE LIGHT PEN

The controller offers the option of connecting a lightpen to it. Via interrupts, the horizontal and vertical positions are stored into two registers. HPEN is 7 bit wide (128 positions) and VPEN is 5 bit wide (32 positions). Since this does not provide us with a very high resolution, we can forget about drawing with a light pen.

THE SERIAL INTERFACE

Here we find a UART (Universal Asynchronus Receiver Transmitter), that, in it's addresses and functions, equals the good old 6551 so much, that I'm assuming it is. With a 4 bit pre-devider, the system clock (12MHz in the XEP 80) is devided into one of 16 steps. These steps are 3.4, 4, 4.5, ... ,11. The actual baudrate devider is 11 bits wide and is further devided by 16 at the output. In the XEP 80 the baudrate is set to 15625. The mathematics could however also look like this:

12 MHz : 6.5 = approximately 1.8432 MHz
12 MHz : 6.5 = approximately 1.8432 MHz

1.8432 MHz : 6 = 307200 Hz
1.8432 MHz : 3 = 614400 Hz

307200 Hz : 16 = 19.200 kHz
614400 Hz : 16 = 38.400 kHz

Those 19.200 kHz lie within manufacturers specifications. If 38.400 kHz works, is something someone should try out. But since the deviders aren't used up yet (we can even go much faster), why wouldn't it work.

That's it for this
time.
Greetings, your
FloppyDoc

That's it for this time. Hope you enjoyed it. You can reach Atreju (and yours trully) via USF-Net and IAN.

CU Mathy Van Nisselroy

PS Please remember, I don't know much about hardware (and only a little bit about translating).

jeking@xmission.com (James King) sez:

> I'd really like to see an auto dialer. Manually having to redial a busy
> number really gets to be a pain.

Redial is proving to be somewhat of a conceptual sticky wicket. I could
(somewhat) easily code a simple dialer routine that would let you type in a
number and keep trying it until it connects, or I could take the more
flexible approach of implementing a macro language that would let you do
your own autodialer. Currently I'm favoring the latter approach.

From: mathniss@link.xs4all.nl
Message-ID: <49kvvs$4fj@link.xs4all.nl>
Source record: 87395

Howdy folks

I'm looking for the address of Larry Richardson, autor of the VTEX textreader.

I've send him a letter, using the following address;

Larry Richardson
5521 Madrid Avenue
Orlando, Florida 32807, USA

(this is the address mentioned in the DOC files)

It came back, marked "RETURN TO SENDER". Seems like the receiver wrote
"please forward, not at this address" on te envelope. USmail attempted to
do so, but have no forwarding address.

So now I'm looking for Larry's current address. Please help.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

PS if you do not know VTEX version 1.3, it's a text reader. Runs under
both MyDOS and SpartaDOS. Allow you to read a text screen by screen, forward
and backward, reads text containing Ctrl-M Ctrl-J text. Has the ability to
delete (on the screen) leading spaces (nice when reading text prepared for
copying to printer). Will do both case sensitive and insensitive search.
You can mark and save blocks of text. I've tried VTEX with textfile 730
screens long. NO PROBLEM.

Howdy Folks

The following article was translated by me, Mathy Van Nisselroy (mathniss@link.xs4all.nl), with permission of the original autor, Erhard Puetz, a.k.a. Atreju.

Please keep in mind, that I translated this from German to English, while Dutch is my mother language.

Yes, I hated the XEP 80 too, but I read the following article (I was VEEERRRYYY bored) and it seems this baby is quite capable and can be really fast, even with BobTerm.

_____@

The XEP 80

Ever since the 1993 ABBUC Annual meeting (Jahreshauptversammlung) I've been working with the XEP 80 and gained quite a bit of knowledge and experience. I've used the XEP under BASIC, MAC65, BobTerm and from DOS to read texts.
At this time I want to ask everybody who's got information not mentioned in the manual, to send it to me. I'm especially interested in Information about the Hardware. Like, what graphicsprocessor was used?
While working with the XEP some very annoying things cought my attention. First there is this constant need to switch video plugs. Really nerve recking is readjusting of screen height, horizontal screen position and brightness. The height of the screen is almost right when the XEP is working in the American TV-standard with 50 Hz. But then the screen flickers and who knows how long the monitor will put up with the imposed 60 Hz. I once read that the higher screen frequency increases the current in the coils (Comment by Mathy: I don't quite know what these coils are called in English, but the direct the electronic beams that draw the picture on your cathode ray tube (according to this booklet I have)). This increases the load on both the electronics, which might not be designed to handle this higher current, and the coils, which might burn out. After switching to 50 Hz though, the screen is significantly higher than the standard XL/XE screen, pushing both upper and lower parts of the graphics off the screen. And the characters look really course. Once readjusted, one is rewarded with a good 80 character screen.
I've heard people say, the XEP would be slow. Well, when I print text to the XEP screen (X:) (original device driver), it rushes by so fast I hardly have time to press Ctrl-1 to halt the screen. Slow you say? Absolutely not, rather fast actually, in my opinion much faster then

the original screen editor (E:). So I tried out some demo's. So this is it, they really are slow. But why? For this purpose I printed out one of the BASIC-listings and read through it. And read it again, and again, and again... Oh my God, who committed this crime...Oops, programmed this. At that time I didn't understand the programme, but it was one big chaos and even on the first glance one would find the slowest BASIC solutions. So, I'm gonna cut this thing short and state: the XEP 80 is fast. And this is mentioned in the manual really: Data transfer speed between XEP and computer takes place at 15.7 kBit. That's quite fast, but why this rare number? Why not 19.2 kBit? In that case the XEp would be able to keep up with the highest transfer rate of BobTerm. And why on the other hand, can the XEP only keep up with speeds of 4800 baud under BobTerm, where it should at least get 9600 baud?
Let's start with the number 15.7 kBit. This means 15700 bits per second. The duration of one bit in this case is approximately 63.7 us (micro seconds = 10^-6 or 0.000001 sec.). The time the microprocessor in our computer needs to execute a command is measured in cycles. With the Atari 8bit every cycle takes approximately .564 us. One bit therefore takes about 113 cycles. The execution of a command takes 2 to 7 cycles. While one bit is send, the computer could execute 16 to 56 commands. Let's use an average of 35. Then we can say one thing for sure: our 8 bitter can handle a transfer rate of 15.7 kBit hands down. Back to the question why it only works up to 4800 baud under BobTerm. Here's part of the XEP driver (V1.2) for BobTerm:

```
LDX #$00 ; Load X with zero
SEI ; don't execute IRQ's
STX $D40E ; disable NMI's
STA WSYNC ; pause
STX PORTA ; send startbit
STA WSYNC ; pause
STA PORTA ; send bit 0
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 1
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 2
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 3
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 4
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 5
ROR ; next bit
STA WSYNC ; pause
```

```
STA PORTA ; send bit 6
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send bit 7
ROR ; next bit
STA WSYNC ; pause
STA PORTA ; send Mode bit
LDA #$FF
STA WSYNC ; pause
STA PORTA ; send stopbit
STA $D40E ; enable NMI's
CLI ; IRQ's permitted
LDX #$20 ; wait 90 us
DEX
BPL LOOP
LDA PORTA ; read XEP status
AND #Mask ; ($02 or $20)
BEQ Busy ; XEP not ready yet
RTS ; ready, 1 byte sent
```

Everywere, where it reads "pause" the computer does the following: NOTHING. This command tells the computer it should halt the microprocessor until one screen line is processed. This seems to take up as much time as one bit at 15.7 kBit, or 63.7 microseconds. This command was issued 11 times, add to that the 166 cycles in the 90 us waiting loop, where the computer can't do much either. That makes 866 cycles or maximum 431, on average 250 commands, the computer can not execute, just because it is halted. The data BobTerm receives via the RS232 interface however, come in faster then they can be processed. The data not processed in time are lost. And this only because the computer is busy doing nothing while transfering data to the XEP. How could one change this and why could the XEP print to screen even faster yet? The computer has to the whole job, like for instance preparing the next byte that should be send to the XEP, in the time between 2 bytes. But what if the next byte to be send would instantaneously be available? The computer should get it from the buffer or wherever, while 1 byte is send to the XEP. To achieve this, the byte should be automatically - without the CPU having anything to do with it - be send and this is done by HARDWARE. Such a device is built into the computer and calls itself POKEY. That's the chip that, among other things, handles the datatraffic with your disk drive, printer and cassette. If we then think about how fast the data transfer with a disk drive can be, namely 51 kBit/s with a Speedy or even 78 kBit/s with the HSS Copier (Mathy: both are German hardware upgrades for the 1050 disk drive), it becomes clear what advantages there are to use a hardware solution. As far as I can see, POKEY can not be used for datatrafficing with the XEP, because the XEP uses 9 bit data words during data transfer, where POKEY only uses 8 bits. A standard SIO chip, like the 6551, should do it. Th nineth bit, used to distinguish between data and commands, could be emulated by the

parity bit. And here the 6551 has five possibilities: None, odd, even, mark and space parity. How we would handle the nineth bit when the computer receives it is one of the things I have to think about, but it should be possible.

Organization: America Online, Inc. (1-800-827-6364)

For Sale: Atari 8-bit Equiptment (2 (Yes 2) Atari 800's + 1050 disk drive)

Original Atari 800 8-bit computer with 1050 Disk Drive (Modified with ICD computers Disk Doubbler) Cartridges, books, manuals, over 200 disks of software -way to much to list. All for 75.00 - act now and I will throw in a Supra 2400 Baud modem, and a second Atari 800 (Needs os board + Keyboard) for free.

Please E-Mail me if you are intrested.
Micael Mielko - Master Sounds Entertainment

The registered version of APE will allow you to access your PC modem @ 38.4k BPS
using a MAX232 SIO2PC type cable.

Works great w/ my Cardinal 28.8.

Welcome to:

THE UNOFFICIAL ATARI 8-BIT NEW USER, EMULATOR HELP FAQ

Revision 1.0, November 30, 1995

By Bill Kendrick

------------------------------------------------------------------

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
Atari 8-bit FAQ
(http://www.smartpages.com/faqs/atari-8-bit/faq/faq.html)
You can also ask the FAQ keeper, Michael Current, for a copy at:
mcurrent@carleton.edu
------------------------------------------------------------------

Summary of Atari 8-bit's and emulated 8-bit Atari's:

* Real Ataris: Atari 8-bit computers were produced between 1979 and
1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when
made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends
when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile
Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC
can be purchased on cartridge for the 400, 800 and 1200XL.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.x. Limited Public Domain demo.
o PC Xformer 3.0x. Powerful Commercial version.
+ On Apple Macintoshes:
o Rainbow. Limited Public Domain demo.
o Rainbow. Powerful Registered Shareware version.
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.x. Limited Public Domain (previously
commercial).
+ On UNIX and X Window: (including PC and Amiga)
```

o Atari 800 Powerful Public Domain version.

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and 40 x 12 x 128-multi-colored-character screen modes are available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
* Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
* All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution (3.5 octaves), 4-bit volume-resolution, and 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
* A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was rerouted through the normal audio output, and the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double

the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten fed up with the XF2-based questions which did not pertain to them, or to the very simple questions which came up time and again which bothered regular readers / digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?"

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement to the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.

2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (Note: Not all (versions) of emulators support XL/XE modes!)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC program! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not easily available to an emulator), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.
3. How do I turn off BASIC?

To toggle BASIC on and off in PC Xformer, press [SHIFT]-[F10].

To toggle BASIC on and off in Rainbow, ???.

To toggle BASIC on and off in Atari800, ???.

To toggle BASIC on and off in ST Xformer, ???.
4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not
supported on some versions of emulators.

See "Why doesn't this program load?", above.
5. How do I exit the emulator?

To exit PC Xformer, press [F5]. Note: this does NOT temporarily
'shell' or 'jump' to MSDOS.

To exit Rainbow, press [Apple]-[Q] or select "Exit" from the
"Apple Menu".

To exit Atari 800, ??? or close the window.

To exit ST Xformer, ???.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image installed in drive 1
("D1:").
7. How do I use files which are not in disk images with an emulator?

To "install" files as though there were plain disks with PC
Xformer, simply add the files to the command line and use them as
their respective drives (be sure the first drive is a DOS-bootable
disk image).
Example: XFORMER MYDOS45.ATR filename.ext

To use a file from your Mac in Rainbow, make sure the disk image
in drive 1 has enough space for the file, and select ???. The fill
will be added to that disk image.

To use Unix files in Atari800, use the H drive. ???.

Use the MSDOS program S2PC which allows you to access files within
a MyDOS/compatible .ATR disk image. S2PC let's you read, write,
delete, change directory, and view the directory of a
MyDOS/compatible .ATR disk image. It can be used via command-line
parameters from MSDOS, or as a menu.

Use the MSDOS program ATARIMG, which is much like S2PC but has a
nicer, more graphical (less-menu driven) interface.

(Unfortunately, this doesn't run on all IBM's!)

Use the Mac program Virtual Disk Editor ???.
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as most Atari emulators. .XFD files are used by ST Xformer and PC Xformer.
9. What's SIO2PC and APE?

Refer to the SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives. ???

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced Atari 8-bit users). No emulator-specific information will be presented.
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to "dir i:*.*")
+ [A] Disk directory (like "dir " and optional output destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one place or disk to another, just "[source]" copies from one place on one disk in a drive to the same place on another disk in the same drive (asks for swapping))

+ [D] Delete file(s) (add "/N" to delete without being prompted
first) (add ">*.*" or ":*.*" after a subdirectory name to
delete the files within it. A subdirectory name alone will
delete the subdirectory (if it is empty and unlocked)). (Acts
like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but
be careful). (like "ren [old] [new]" in MSDOS - with MyDOS,
use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending
(like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which
boots with the current version of MyDOS you are using and
also has the menu file "DUP.SYS" on it as well). (This is
like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a
quick-format of an already-formatted disk (ie, just a very
fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot
sector, when using XFormer, it's much quicker to just copy
one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it
binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like
"[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ",
etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is
"E477", reset is "E474" (these are the hex values of the
addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from
BASIC, for example) it will write what is in memory to a file
"MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost
forever. When you exit DUP.SYS with the "B: Run Cartridge"
command, MEM.SAV is reloaded and the environment should be as
it was when you left. It's probably quicker to simply "SAVE"
your programs (if in a language) which aren't nearly as big
as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly
for advanced users or special setups. See the MyDOS docs for
details.
+ [P] Set density. Forces a drive to be recognized at a certain
density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in
SpartaDOS) This makes "D:" now the same as a subdirectory or
other drive. ie, "D2:" will make all calls to "D:" act as
though they are to "D2:" instead. Some programs when
prompting for filenames do not add "D:" to the beginning if
one is not present, they add "D1:". If you don't trust a
program to look to "D:" instead of "D1:" and you want it to

look to some place OTHER than "D1:" (ie, where "D:" is
pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s
if they aren't in the filenames you give and may give errors
(138, for example: device not present, ie, if you said
"TESTFILE.DAT" it may think you want "T:" instead of
"D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify
is on, writes will be slower but 100% reliable. With it off,
writes will be much faster but possibly not as reliable (on
bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are
identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some
densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not
present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk
to another using only one drive. (In MyDOS, giving just a
source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k
(Single Density) disks. To format an Enhanced Density (127k)
disk, just use [I]. In DOS 2.0, [I] is the only format option
and only handles 88k. (I may be wrong, but I have never had a
Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is
on disk (SpartaDOS X is on cartridge). When the Atari boots
up, it does some of its 'boot-up stuff' which includes
looking for a disk drive connected and turned on which is set
up as drive #1. It then begins to load from the disk's "boot
sector". If none exists or there's a nasty error on the disk,
you get the "BOOT ERROR" notice until the error is fixed. (On
SpartaDOS disks, even non-bootable disks have a boot sector,
but all the boot sector is is a small program which displays
a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the
disk drives' starts with 'you must boot the Atari with a
DOS'. Check the 8-bit FAQ and the UMICH and other FTP
archives for lists of DOSes available for Ataris, but the
most used are Atari DOS (for compatibility with almost ALL
older software), MyDOS (for an Atari DOS compatible high-end
DOS), and SpartaDOS (for a very high-end DOS which looks much
like MS-DOS but unfortunately cannont run all software which
runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT
run on Atari 400's and 800's (except the cartridge versions

and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.

Here's a comparison to using subdirectories on different DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the
'current' or 'default' directory to a different place (a
different drive or a subdirectory). "D:" can stand for "D1:"
(like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ
THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files,
multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard
and output to the screen is normally handled. If you
wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o M: "Multiplexer"
Readable, writeable. For Atari's connected to each other
via a "Multiplexer" local area network, the "MUX"
Operating System replacement provides an "M:" device for
computer-to-computer communication.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using
"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded

which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line
into the current program.
* Entering a line number alone will remove that line from the
current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command
followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional
destination device ("D:file.lst", "P:"rinter) and an option start
and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced which
will be based on examples provided in the Atari BASIC Reference
Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
* Reboot with [OPTION] held down to disable BASIC. (For emulator users, remember there are ways to totally disable BASIC.)

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing when it appears. One problem, however, all screens overlay each other so unless you only use certain modes at certain times, parts of some screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text
* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)

* DRAWTO x,y - draw a line from cursor location (set with
"POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command
colors:
* COLOR 0 will draw using the background color, set with SETCOLOR
4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd
into memory locations 704, 705, 706 and 707 (the player/missle
graphics color locations). Examples of this will be presented in the
BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)
* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT
[CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line

Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)

Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! [grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.
* When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having an image burned on it.
* To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also variations on these are available in most other Atari languages!):
* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary mode 'c'. Channel 'a' must be free or else a 'Channel already open' (129) error will occur. To explain the different "modes", here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"
Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'
* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line' (character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line' (character 155)) from channel 'a' and stores the numeric value of it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the information to channel 'a' (semicolons, comas, and mixed types are of course allowed).

* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks.
Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a

demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive! [cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and not "ATR"? To keep people from getting confused with the ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR" which works on PC's (a PC executable version comes in the archive) and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

+ PC Xformer 2.x can be downloaded via FTP from:

I was wondering myself if there is a way to hook up something
like an Atari 2600 (or 8 bit using the TV output) to one
of these types of monitors with all the RCA inputs. Anyone
know? Is there a way to hook what's meant to go into a
TV switchbox to an RGB connector?

Rick

Thanks for the Info, it was exactly what I needed.

David

3880. Re: Does anybody use TopDos?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-01 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148290@cup.portal.com>
Source record: 87311

I'd like to think were DOS tolerant here, doesn't matter what you use &
I've never heard anything but good stuff about Top DOS. Main reason
why I started using SD are it came with the US Doubler I bought, it
gave me high speed I/O with the US Ultra Speed along with 180k of
storage. I used to do a lot more programming then I do now & I used
to do all my compiles from memory, but I got better<g>. The extra memory
with the ability to go to DOS without having a memsav was really convenient
for this style of use. My main computer was a 256k XL so the ICD 192k
ram disk made a lot of stuff more easier/quicker. ICD also had a
an account on the CIS 8 bit sig where they would read the all the post
& answer any questions about their products: Best support ever for an
Atari product if you were on CIS which was really the only game in town
at the time. I also ran an 8 bit bbs for a while when I wired up my
2nd 256k XL. In general, telecomunication programs of all kinds just
ran better because of the high speed I/O, 192k ramdisk.
When SDX first came out, I was still doing a lot of programming for
people who needed USR()s from BASIC. The ability to have my ASM/ED
or MAC cart plugged into SDX to write the routines with the ability
to switch MAC=>DOS=>BASIC w/o having to shut down my computer was
a great time saver.
As you mentioned, it is possible to screw up disks with SD. I'm not
married to SD, matter of fact I'm probably one of the few people who
actually bought MyDOS. *BUT* IMHO, 90% of the people who complain about
SD have never bought it & of those who did, they usually haven't read
the manual. I got this impression by telling people that were complaining
stuff like, "Read page XX of the manual" & getting responses like
"What does it say, I can't find my manual."
But now that I'm older, I program less & find I like to do all my
compiles from disk. Steve Tucker has triple speed I/O working on
APE/SIO2PC under MyDOS so it's even faster then the US Doubler. As
such, I find myself using MyDOS more & more.
Rick

3881. Re: Atari 800 upgrade to 65c816 (nice and simple)

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-01 00:00:00 UTC
From: sloopy@alaska.magpage.com
Message-ID: <49llte$ll1@tofu.alt.net>
Source record: 87312

Evan Samuel (esameul@iamerica.net) wrote:
: This is a multi-part message in MIME format.

: ----------------------------------32400236027073
: Content-Transfer-Encoding: 7bit
: Content-Type: text/plain; charset=us-ascii

: This is the upgrade to a 65c816 for early model 800 Atari computers.

: ----------------------------------32400236027073
: Content-Transfer-Encoding: 7bit
: Content-Type: text/plain

: This is all you have to do. Remove and replace the cpu, and place a Jumper
: wire at A303 pin36 to Z302 pin 5. Then the 800 becomes 16 bit. You will
: not notice any chances when you power up because the 65c816 powers up in
: 6502 mode. To take advantage of the cpu, you must write your own programs
: to utilize the advanced features. NOTE: When your 16 bit software runs,
: you must disable the IRQ, and Vertical Blank Interupt to prevent a system
: crash with your 8-bit ROM operating system. As for the memory upgrade.
: I'll check my notes and let you know. Its not difficult, but not as easy
: as the CPU. During the last year or so of production of the 800. Atari
: had upgraded the 800 CPU CHIP to the XL CPU CHIP. This mode is more
: extensive, due to the missing chips used on the old board. To upgrade
: these boards the missing chips must be reinstalled with the 65c816 using
: a piggyback board. The 6502C is not 100% pin compatible with the older 6502,
: so the board must make the neccessary pin changes.

: ----------------------------------32400236027073--

also if you get a 65802 you can pop it right in and it works fine.... (i
posted this finding when i was in college about 5 years ago....but... ;')
the 65802 is a 65816 with a 6502 pin out on it...as for a supply of
65802's.... hmm leave me mail and i will look in a few places if anyone
is interested....

Well I have ordered from ya in the past and thought you were gone!
anyway
I still use my 800/800xl ect... and would enjoy one of your cataloges! I
guess I better buy before its too late! I need SIO cables ect... so please
send me one
of those cataloges...

Thanks!!

3883. Re: : 8-bit floppy -> .XFD file; What's the easiest way?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-01 00:00:00 UTC
From: tom-sue@ix.netcom.com
Message-ID: <49nvfa$crt@cloner2.ix.netcom.com>
Source record: 87314

Is there a program that works... for an IBM/CLONE to read an Atari disk
and put it to a file like .XFD or .ATR? I have Xformer and Anadisk but
no success. Can anyone help me...?

Tom

3884. Re: : 8-bit floppy -> .XFD file; What's the easiest way?

From: "Ernest.R.Schreurs" <ernest@pi.net>
Message-ID: <49lhtn$gsh@neptunus.pi.net>
Source record: 87315

Converting between XFD and ATR format is not that hard. On the POOLDISK
cd, there are two programs written by Bo Schreurs that do that. You can
also use wildcards, so you can convert all files in a directory with one
simple command. Source code is included as far as I can remember,
We have never sent stuff to Umich before, so, that is the only reason
we have not posted it there. By the way, the Pooldisk CD contains all
files in XFD format too, so if you want 2000 XFD disk images, you can
still send us a check for US $35 and you'll get one. In the meantime
I can try E-mailing you the program. It is written in PC-Assembler.

The first three could have come right off my wish list! Thanks! :)
As for the augmentation of the macro language, what did you have
in mind? It seems fine to me . . .

-Colecovision w/ power supply & joysticks $20.00 min
-Atari 2600 w/ joysticks $10.00 min
-TI 99/4A Speech Synthesizer $8.00 min
-Channel F system w/ joysticks, ps & rf converter $20.00 min

-Atari 2600 Driving Controller $3.00 min
-TI 99/4A Joysticks $5.00 min
-Commmodore 64 Computer $10.00 min
-Commodore 1541 Disk Drive $10.00 min

TRADES:

I am looking for R/ER/UR carts and a few U□s for
the Atari 2600 and Colecovision only!

HERE ARE THE RULES:

1. This auction will end on SUNDAY, DECEMBER 17, 1995
at Midnight Mountain Time unless there is still heavy bidding. If
so, the bidding will continue until the following Sunday at Midnight.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject should be JOLLY OLD BID.

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $8.00 and $15.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee, no warranty and no refunds
on anything purchased from this auction. Most of the
cartridges have been tested and do work the same goes
for many of the systems. However, cartridges for systems
which I do not own cannot be tested and neither can
systems which have no cables. If you are curious about the

condition of a label...ask.

10. I reserve the right to refuse bids.

11. I reserve the right to alter the rules or the auction itself.

12. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

12b. IN ADDITION, YOU WILL ALSO BE PLACED ON MY
DEADBEAT LIST. THIS IS A LIST THAT I HAVE BEEN
COMPILING REGARDING DEALS WHICH HAVE GONE
AWRY FOR ONE REASON OR ANOTHER. I INTEND TO
SEND COPIES TO ALL AUCTIONEERS ON THE INTERNET
IN AN EFFORT TO KEEP BIDDING HONEST.

Your participation in this auction signifies your consent
to follow these rules as stated.

Hola ..
I'm interested in your 8-bit catalog, Can you send me a copy via e-mail?

In US there is a way to send money to Mexico in a few minutes via Western Union, I don't know if I can do the same thing Here.
Anybody Knows?
M.

: Well, here I am with my new 14.4 kbps modem (Sportster Si), and I find my
: old P:R:Connection doesn't work past 4800 (is that normal? I thought I could
: attain 9600 at least). So what are my options? Of course I can buy the Black
: Box from CSS, and would have liked his R:P:Connection. Mike (FTe) may yet
: produce an MIO II with high-speed RS-232. How fast can I go with anything
: else? Even building something to connect to the end of an SIO cable?

Some of the P:Rs will only do 4800. I have seen a couple do 9600. The
Atari 850 will do 9600. The MIO will do 9600/19.2 and the Black Box will
do 19.2 with full hardware flow control.

The problem is that some of the newer P:Rs appear to be "throttled". I
have actually had better luck with some of the older P:Rs. And I have
always had good luck with the Atari 850s. They will actually allow 19.2
connections in many cases, even if the actual rate is 9600.

Nice to see 19.2 though through my 28.8 Supra when using my Black Box!!

Tom

3890. Re: InfoCom games, etc..

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-01 00:00:00 UTC
From: classics@seka.nacs.net
Message-ID: <49lq5g$g0e@wariat.wariat.org>
Source record: 87399

James King (jeking@xmission.com) wrote:
: I know I have a couple of .DCM files that consist of an InfoCom game that
: was converted into ONE .DCM, even though the original game consisted of
: two disks.

: How is this possible?

: I've just recently purchased ALL of the InfoCom games, and now wish to
: put them each on a 720k hard disk partition, but since almost all of the
: original Infocom games are 1 disk (side 1 and two), I'm not sure how I
: can accomplish this.

: Any help greatly appreciated.

A number of the early infocom games ARE one disk. I doubt anyone 'converted'
2 disk games to one disk, since the entire 720 sectors of most of the
data disks are used up on the infocom games. If there were more than
720 sectors available, then its possible.

You COULD however convert the front disk loader into a file quite
easily. As I recall, they are simple 2 stage booters w/ no copy
protection. A bit of hacking would be required.

I have a couple 4 disk games that I converted to run on a single
360k DS/SD disk. I used a special OS (a hacked version of the
Atari Translator disk actually) that diverted all calls for drive
2-4, back to drive 1, just + 0x2d0*(drive - 1) sectors. Worked quite well
for games that supported multiple drives for the data disks.

Oh, and another idea, buy Lost Treasures of Infocom I & II ;) Might fit all
of them on a 720k disk then! :)

3892. PC Xformer 3.3 now available

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-01 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <49ndhp$4dp@news1.halcyon.com>
Source record: 87401

Tomorrow, PC Xformer 3.3 goes on sale at the Toad Atarifest and will be available next week from Atari dealers in Europe as well. I have just put up a new demo version of PC Xformer that is in sync with version 3.3. It is up on the PC Xformer web page at

http://www.halcyon.com/brasoft/

Look in the file download area to download xf33demo.zip

This new demo replaces PC Xformer 2.0 and 2.5 which were based on old source code and don't make for a good demo any more.

PC Xformer 3.3 is now the world's fastest Atari 8-bit emulator, with support for player missile graphics, display list interrupts, GTIA graphics, and both Atari 800 and XL/XE emulation modes.

On a 90 Mhz Pentium it runs at about 10 times the speed of a 130XE, although there is the option to slow the emulator down to normal speed to make certain games more playable.

As before, PC Xformer 3.3 costs $34.95. We've re-written the manual for PC Xformer 3.3 to make it easier to read and it now includes new demos and file transfer utilities not included before.

Hmm.. if it's REALLY old, then I might understand why it doesn't go past
4800bps.. but the current P:R: goes up to 9600bps. If and when teh MIO2 is
released, we'll all be happily modeming at 19.2k with our nice 40meg IDE
hard drives that we got for almost nothing at garage sales :)

Yup.. there's definately an upside to the Atari 8-bit.. it's even
environmentally friendly! :)

I was able to download some other stuff without problem. Anything in the 'New' subdirectory is, apparently, off limits to downloads. ???

Anyway, a visit back today and I get a '404 URL Not Found' error.

Can someone maybe email me a copy of this? I'm anxious to try it out.

Thanks!
Scott

3897. Weird Atari Dream

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-02 00:00:00 UTC
From: tbauer@saul4.u.washington.edu
Message-ID: <49o6tv$p9p@nntp5.u.washington.edu>
Source record: 87319

Hi Atari fellows,

Had a really weird dream last night. I keep wanting to call a friend to see about purchasing his 1200XL. Anyway, I dreamt last night that I was over at his place and that he upgraded his Atari 800 (where's the 1200XL ??) with a card that contained a 65816 (like the AppleII GS) and had VGA graphics. Then I woke up. Bummer.

Later,
Tom

14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM,

ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

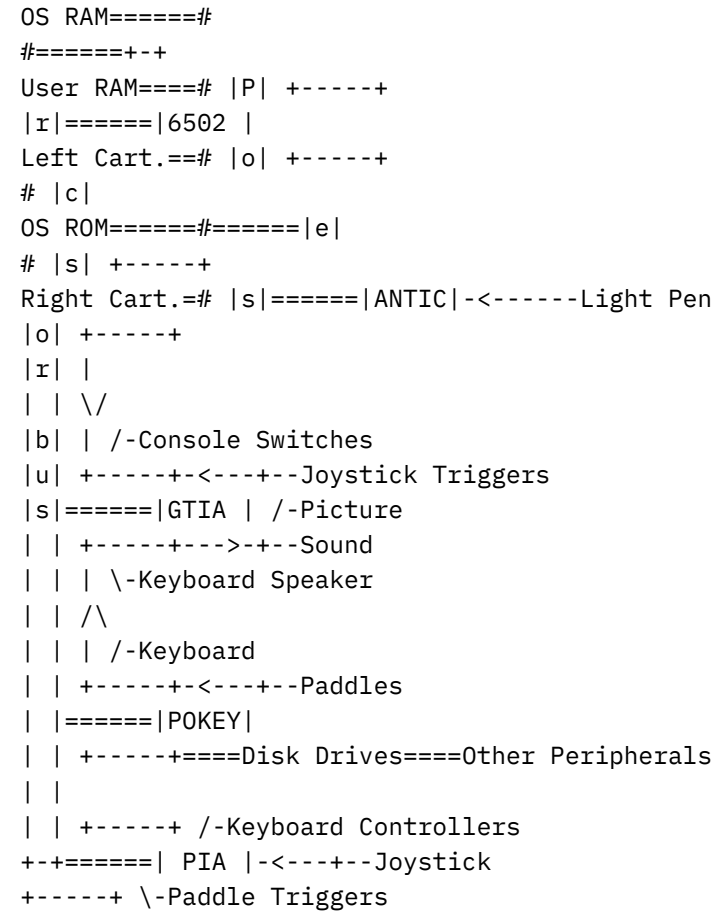
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexor. According to URL:mailto:sup8pdct@closer.brisnet.org.au (James Bradford), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is

beyond me. An 800XL can look like a 130XE with that 16-pin chip installed
(That's right NO freddy) and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, URL:mailto:kendrick@sonoma.edu , for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text

2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen
modes are available.
Screen modes can be mixed (by lines) down the screen using the Display
List (a program which is executed by the ANTIC graphics chip every
screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.
All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

According to Doug Neubauer (by way of URL:mailto:finneganj@delphi.com (James
Finnegan), here is the team that originally designed the Atari 400/800:
<quote>

The A800 VLSI hardware guys include:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators (from the grass valley group)
Joe Decuir - Antic and system and creator
A french guy (whose name I forget) - Antic logic designer
George McLeod - CTIA and GTIA logic design

Doug Neubauer - Pokey logic design
Mark Shieu - Pokey chip design
Steve Stone - Pokey layout design
Steve Smith - Technician for antic and gtia
Delwin Pearson - Technician for Pokey

There were a number of other people whoses names I have forgotten.
I have lost touch with most of them.

<end quote>

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through URL:news:comp.sys.atari.8bit . This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

comp.sys.atari.8bit is archived by the INFO-A8 list server.

Subject: 2.2) What is comp.sys.atari.announce?

URL:news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from URL:mailto:lexicor@world.std.com .

Subject: 2.3) What is comp.sys.atari.advocacy?

URL:news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

URL:news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

URL:news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

URL:news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at URL:mailto:emulators-request@qualcomm.com .

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

URL:mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, or to start a new thread, send your posting to:

URL:mailto:comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Postings sent in this way automatically appear on comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to atari8@netcom.com will NOT be cross-posted to comp.sys.atari.8bit, so don't send your posting there. The Moderator hopes to correct this in the future.

The Info-Atari8 Digest is archived by the INFO-A8 listserver.

Recent copies are also kept at URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd,
URL:mailto:snyder10@convex1.TCS.Tulane.EDU .

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this
discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
URL:mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to

URL:mailto:comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Postings sent in this way automatically appear on comp.sys.atari.8bit and in
the Info-Atari8 Digest.

Any postings sent to info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach
comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command
to LISTSERV@MARIST, or by sending a message to
URL:mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please
note that this command must NOT be sent to INFO-A8@MARIST or to
info-a8@vm.marist.edu.

---The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8---

You can obtain a list of the available archive files by sending an "INDEX
INFO-A8" command to LISTSERV@MARIST or by sending a message to
URL:mailto:listserv@vm.marist.edu that says "index info-a8". These files can
then be retrieved by means of a "GET INFO-A8 filetype" command, or by
using the database search facilities of LISTSERV. Send an "INFO DATABASE"
command for more information on the latter.

Recent copies are also kept at
URL:ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason
Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
URL:mailto:ravi@mcnc.org (Ravi Subrahmanyan)
URL:mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you get started using it, try this example of retrieving files from the Merit/Umich Software Archives (through the barnone.citi.umich.edu mirror site). Send a message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.4) How can I post to Usenet newsgroups by e-mail?

From the internet-services/access-via-email FAQ, maintained by "Doctor Bob" Rankin.

Mail the text of your post to:

```
group.name@news.demon.co.uk
group.name@dispatch.demon.co.uk
group.name@bull.com
group.name@cass.ma02.bull.com
group.name@paris.ics.uci.edu
group.name@crs4gw.crs4.it
group.name@berlioz.crs4.it
group.name.usenet@canaima.Berkeley.EDU
group.name-news@newsbase.cs.yale.edu
```

For example, to post to comp.sys.atari.8bit, you might send your message to:

comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Be sure to include an appropriate Subject: line, and include your real name and e-mail address at the close of your note.

Subject: 3.5) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com (Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to mailto:listserv@info.cern.ch (older address) containing the following single line. (What you put on the subject line doesn't matter; blank is OK. This line should go in the text of the message.) You will receive as a reply a simple page intended to help you learn more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. For more information:

Jody Lenn, mailto:lenn@atari.archive.umich.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

URL:file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

URL:gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
URL:gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
URL:gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/
URL:gopher://gopher.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari/8bit

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

URL:http://www.umich.edu/~archive/atari/8bit/

A mirror web site:
URL:http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

URL:ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
URL:ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
URL:ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
URL:ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
URL:ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit/
URL:ftp://barnone.citi.umich.edu/atari/8bit/ (<-- RECOMMENDED)
URL:ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
URL:ftp://ftp.toad.net/pub/umich/8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can
I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You
might also suggest what permanent 8bit subdirectory you'd like your file to
end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn). Please
name the parts in the subject line. This is really helpful as the parts

usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to have seen no uploads for years, but there are some files here that aren't on any of the other sites. [IS THIS SITE LOST? - 10/13/95]

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen, mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves them to the appropriate directory. Please include a .readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson, mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock: ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the QACE Archive?

The Queensland Atari Computer Enthusiasts have a fairly large FTP site. It is
located in Australia and is the local internet sight of Super Products.
Contact James Bradford, URL:mailto:sup8pdct@closer.brisnet.org.au for more
info.

URL:ftp://203.4.149.98/8bit

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu (Atari SIG).

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari Users SIG?

National Capital Free-Net (Ottawa, Canada)

Internet access to NCF is via

telnet://guest@freenet2.carleton.ca (134.117.1.39) type "go atari" at any menu
telnet://guest@freenet3.carleton.ca (134.117.1.22) type "go atari" at any menu
gopher://gopher.ncf.carleton.ca and choose:
'National Capital Freenet (NCF) Information by Gopher'
http://www.ncf.carleton.ca/freeport/sigs/computer/atari/menu/

This is the Atari computer(*) users special interest group.

Select the Bulletin Board for the latest Atari related news on the SIG
To get information on the other options select the menu option in question
and read the ABOUT message.

For more information, please contact Jack Kitowicz (ac382) on the
National Capital FreeNet. Comments & Suggestions for improvements to the
Atari SIG are always welcome.

Subject: 5.4) What is the Victoria Free-Net Atari Computer Users SIG?

Victoria Free-Net (Victoria, Canada)

telnet://guest@freenet.victoria.bc.ca (199.60.222.1)

type "go atari" at any menu

Facilitators: Gord Hooper (mailto:ua558@freenet.victoria.bc.ca)
Ted Skrecky (GCACE Librarian)
(mailto:ud264@freenet.victoria.bc.ca)

The aim of this SIG is to assist Atari Computer users. We can provide
assistance with XL/XEs, STs, and Falcons, whether you are a new or
experienced user.

Subject: 5.5) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.6) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

8-bit Vendor/Developer home pages are listed in the Vendor/Developer list, not
here.

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.smartpages.com/bngfaqs/comp/sys/atari/8bit/top.html

Toronto Atari Federation
Stephen Christian, URL:mailto:schrist@io.org
http://www.io.org/~schrist/taf.html

Subject: 7.9) What IRC channels discuss the 8-bit Atari?

#Atari8 - Just for 8-bit Atari users!

#classic - Classic Games and Systems Collectors.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
filenames: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the four emulators that are usable.

1) ST Xformer 3.0, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.
Net location?

2) PC Xformer 3.2, from Branch Always (see companion Vendor/Developer List for complete contact info). The 8-bit Atari emulator for DOS/Windows/OS/2. Versions 2.0, 2.5, 2.52 are freeware; 3.0 was the first commercial version; 3.2 is the latest commercial version; 4.0 for Windows 95 is coming soon.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MYDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

filename: Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
filename: Sio2pc/dcm2dsk2.zip

3) Rainbow, by Chris Liam, for the Apple Macintosh
URL:mailto:lamcw@aston.ac.uk
URL:http://www.aston.ac.uk/~lamcw/emulators.html

4) Atari Emulator for Unix and Amiga, by David Firth
Latest version: 0.1.8
URL:mailto:david@signus.demon.co.uk
URL:ftp://ftp.demon.co.uk/pub/emulators/Atari800-0.1.8.tar.gz
(158.152.1.44)

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None

Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
filename: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive, can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB, and then reformatted on a 1.2M drive to 360k, can be read reliably only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the Atari for Atari to PC transfers, format truly blank disks on the PC for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the following combination of utilities can be used to work with SS/SD 90K Atari-format disks, and is currently the best bet for reading SS/ED 128K Atari-format disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read FM disks (I'm not sure what the criteria for that is), then you can read single density disks on your PC by dumping the contents to a file with AnaDisk, and then using Deana.com to convert the dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first portion of each sector, but it demonstrates that it is possible for a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low

density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus),

then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD 19.2Kbps standard

==> Happy 810
SS SD Warp speed

==> Atari 1050
SS SD/ED 19.2Kbps standard

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track
buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) used w/ Bibo-DOS (Compy Shop)

==> SuperMax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)
by Super Products. Compatiable with SuperDOS and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:

- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary; full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)

Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
filename: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
filename: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)~same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink software
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term software
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF late 800XL with a redesigned motherboard, & FREDDY (from the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card

XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial
programs. I haven't heard anything about OASIS IV and CARINA for a while,
but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 13.6) What version of Atari BASIC do I have?

Subject: 13.7) What are the Standards for Used 8-Bit Stuff?

Developed by mailto:b.poehland@genie.geis.com (Ben Poehland)

When selling used 8-bit Atari equipment in the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group, please consider describing the condition of the materials you are selling using these standards. This will go a long way toward preventing potentially highly-contentious misunderstandings. Usage is voluntary, but recommended.

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging materials.
EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories; heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations, among many others:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html

If you send it to me (send it to ftp://ftp.dartmouth.edu/pub/dropoff/ and
send me email so that I know it's there), I'll upload it to UMich. I
connect there through AFS, so I don't have to worry about anonymous ftp
limits.

--PC (who has a N.Kennedy-built SIO2PC device)

Hmm - I guess because the way you're getting in locks "New" directory files
from read. Try FTPing to amiga.archive.umich.edu. (Careful with the CD
command, though).

Or I can e-mail it to you if you'd like.

Hi,

Does anyone here have contact information (ideally physical address or E-mail address) for Chris Karchnak (who used the pseudonym "Buckaroo Banzai")?

He's a very neat person used to be very, very active in the Washington DC area Atari community in the 80's/early 90's, and I lost contact with him around the time I went to college, and I'd love to get in touch with him again to see what he's been up to.

THANKS!

3904. I Need the Atari 8-bit Chipset Numbers for 130xe

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-02 00:00:00 UTC
From: "Ronald A. Laski, Jr." <ronlaski@cris.com>
Message-ID: <49p6b3$rhv@spectator.cris.com>
Source record: 87326

Hi,
I have the Newell 1 meg upgrade for the 130XE computer. I have the memory chips in it. I have the installation instructions. What I don't have is a list of numbers for what chips are what (and what orientation they are in). I'm not afraid to install the board myself. What I am afraid of, however, is installing it incorrectly. Once I am satified that I have all the info I need, I will get the darned thing installed. Also, I know that some of the chips have different numbers although some of the numbers may be similar. 130xe's are hard enough to come by without me burning mine up. Any help anyone can give me would be greatly appreciated.

Thanks,
Ronald A. Laski, Jr.

Source record: 87327

>Don't get things wrong here: I wasn't complaining, I was ASKING. That's
>what is newsgroup is there for.
Well, my point still stands, one should ask Nick Kennedy, although
I am very well aware that discussing a problem and checking with
other users has a lot of value. In the end though, when all things
are discussed, only rarely is the problem written down and
documented and sent to the author. Note that I did not mean you
personally when I wrote people, it it everyone writing about SIO2PC
in the last couple of weeks.

>If SIO2PC 4.04 is still shareware, why don't you post it here?
For one thing, because maybe Nick Kennedy should do that. If he does
not have Internet access, lots of people have the pooldisk that contains
4.04 and they could equally well send it. My problem is that I feel I am
still a newcomer to Internet and don't quite know my way around yet,
the newsgroup looks just like a BBS, so I can understand that easily.
I know there are FAQ files, but for one thing, trying to connect into
Umich using FTP is next to impossible. I use a mirror site to get
things, but to upload it, I think one must FTP it to Umich itself.
So if access is denied all the time, how can I do this?

CLOSET CLEAN OUT SALE

Make me an offer via E-mail on any or all of the items below. All hardware is in working condition. You should include shipping costs in your offer. If your offer is chosen I will ship after your check or money order clears the bank.

ATARI 800 COMPUTER
comes with TV cable, power supply, owners guide, peripheral cable, 48k RAM, 10k ROM, ATARI 800 Basic Reference Manual. Books included, (1)Your ATARI Computer, a Guide to ATARI 400/800 Personal Computers, (2) Mapping the ATARI, (3) ATARI Basic. Cartridges included (1) Basic Computing Language, (2) Centipedes with instruction book, (3) Asteroids with instruction book, (4) Congo Bongo with instruction book.

ATARI 130XE COMPUTER
comes with TV cable, power supply, owners manual, peripheral cable

ATARI 850 INTERFACE
comes with power supply, interface operators manual, printer cable

SIGNALMAN MARK III MODEM
comes with power supply, cable, instructions, Telelink I cartridge with instructions.

ATARI 1050 DISK DRIVES 2 for Sale
Each drive comes with a peripheral cable, power supply, owners guide, DOS 3 with reference manuals. DOS 2.0, 2.0s, 2.5, 2.6f, 4.0, no manuals for these. A variety of software on disk, utilities, database, games and one box of new blank disks.

ATARI 410 PROGRAM RECORDERS 2 for Sale
one has an owners manual, both have a blank tape

SOFTWARE
(1) Synfile + (plus) a database for ATARI 800/130XE computers with user manual
(2) Syncalc a spreadsheet for ATARI 800/130XE computers with user manual
(3) Print Shop and Print Shop graphics library, both have manuals
(4) ATARI Writer Plus word processor with manual

BOOKS
(1) Games for the ATARI
(2) 6502 Applications
(3) Computes First Book of ATARI
(4) Computes Second Book of ATARI

Thanks in Advance

3910. RE: Alternate Reality

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-02 00:00:00 UTC
From: Shadowseek@msn.com
Message-ID: <00001bd9+00001188@msn.com>
Source record: 87332

Now you know something, I was in the same boat when that game came out. I completely agree, one of the best games to ever hit the platform. Makes me sigh just remembering the countless hours I spent building up my experience, mapping the city out block by block. Why did he (phillip) and the gang give up on it? I thought they had a wonderful thing going. Remember all the hype it got in Antic before its release?? Remember the ST version? What happened to all the modules that were supposed to come out for it? The Arena for example? The Wilderness? Never saw the light. They seemed to have ended it right after the dungeon. Too bad.

It would be wonderful if he could redesign the game, complete it, port it-whatever, to today's platforms, and finish the great idea he had.

Phillip, if you're out there...I want you to know that there were many of us that put in a lot of blood, sweat and tears into your vision. I can remember waiting with bated breath for the release of the dungeon. Have you completely lost your inspiration? You know, nowadays we seem to be getting so wrapped up in 8x Cdrom drives, tons of ram, and video that runs at 30 frames a second, blah blah blah. What's missing phil? I'll tell you... Our imaginations are missing. Nowadays many of the games spoonfeed us everything...the world doesn't unravel in our minds on its own. You gave many of us just that...a limitless world that we could explore. The boundaries of which, only some were aware.

Bring back the dream.

3911. Pepper's 300 Cart Auction !!! Update #8.5

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-02 00:00:00 UTC

3914. RGB for atari

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-03 00:00:00 UTC
From: lmull@skypoint.com
Message-ID: <49suc7$hjh@stratus.skypoint.net>
Source record: 87336

I am trying to use an RGB monitor with my old 8-bit. I think
that I can build the cable with stuff from Radio Shack. Does anyone know
the pin configuration for the cable? I am using an 800XL.

Thanx.

--

3915. any Image sites?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-03 00:00:00 UTC
From: nolram@panix.com
Message-ID: <nolram-0312952242300001@nolram.dialup.access.net>
Source record: 87337

Since My 65xe is in no use condition(actually no room condition), I was wondering if there any image sites? Anyone placed PD/Share files on ATR formats?

3916. DOS 2D

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-03 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148438@cup.portal.com>
Source record: 87338

Just thought I might note I got that copy of Atari DOS 2D for the
815 inverted & running. Turns out I may have been wrong in some of
my complaints about it. For instance, when I was using a copy of
what was purported to be Atari Double Density DOS, I was sure I
had to run a utility to switch from single to double density every
time I switched disk. With the version I have now, it seems to be
a little smarter as I can have both single & double density disks
& the 2D reads them w/o any problems. I haven't really wrung out all
the features, does support 3 drives in its default configureation &
will read a MyDOS directory. Anyway, if someone really feels they need
this, email me & I'll see what I can do.
Just another note, I was fooling around with ANADISK, I happen to be
lucky in that my controller will handle single density disks. But
I remembered I saw a blurb about converting an IBM controller to
read FM format disks. It's a short passage in 22DISK & doesn't seem
like it to much of a hack, requires you to cut a pin or two &
find/supply a single inverter function. Once again, if you feel
this is info you must have, let me know & I'll cut the passage
out of the 22disk.doc file.
Rick

3918. old BASIC sound code

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-03 00:00:00 UTC
From: Will Dwinnell <predictor@delphi.com>
Message-ID: <BICkMkR.predictor@delphi.com>
Source record: 87340

Hi,

I am trying to find an old piece of BASIC software which appeared
in a magazine article in the 80s. I don't know the name of the magazine
(it may have been "Creative Computing" or "Compute!") or when exactly
it was published. (I know, it's not much to go on.) The article
was about computer sound effects, and the sidebar was some BASIC
code for the Atari 8-bits which was provided by someone who had worked
on the sound effects for the movie "TRON". The code was not very
long (and would certainly fit into an e-mail message or a post on
a forum like this) and ran a few different sound effects, including
some falling bombs. I realize that this is extremely vague and wish
I could fill in more details, but I don't have them. Thanks for
any help you can provide.

an Atari enthusiast since the 8-bit days,
Will

3919. direct-connect Atari modem wanted

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-03 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <49ti19$p5l@sirius.cs.pdx.edu>
Source record: 87341

Anybody want to get rid of an old modem--not the kind that needs an RS232 interface, but a direct-connect one like a 1030 or XM301? I'd like one for my collection...

I'll pay $5 for a 300 bps model, or $10 for a 1200 bps one, including shipping to zip code 97202.

TIA,
Alex Chamberlain
chambera@cs.pdx.edu

Why prolong the agony?
Just get Windows 95, you'll be glad in the long run.
Why you ask? Because all major software is being
developed for Win95; Where's Office for OS/2?
Besides, you won't have a choice! I mean, why
have an operating system with NO support (ie, MAC OS, OS/2)
no Hardware support (OS/2), and no software support
(all Non-win OS's).

Besides, we all know that OS/2 and the MAC suck,
What was apple thinking when making the MAC OS?
That we should always use the mouse? There are hardly
any keyboard equivalents for using menus. Apple must
think we love using the mouse every 5 seconds; and
with no 32-bit OS, the MAC sucks even more.
And to think, MAC freaks think that MS copied the
Apple interface when making Win95......sorry,
BWA HAHAHAHAHAHAHAHAHAHAHAHAHAHA!!! NOT!!

But don't stop there, look at OS/2. complex beast,
one with no software and hardware support.

So there's little doubt who'll win the OS Wars.
Windows 95, where do you want to go today?

> of these types of monitors with all the RCA inputs. Anyone
> know? Is there a way to hook what's meant to go into a
> TV switchbox to an RGB connector?

Sure, it's *possible*. They both use standard RCA connectors. Just plug it right in!

However, I should point out that this will not provide any sort of coherent picture. That's what you get for plugging things in where they weren't meant to go. And the Commodore 1702 is composite/split video, not RGB.

If for some oddball reason you really, REALLY wanted to hook your 2600 to a composite monitor, you'd have to hook it up to a VCR, then run an audio/video patch cable from the VCR to the monitor.

You'd be better off just sticking with a TV.

I would try it with a different modem first. I've looked at the Si, and
from the documentation it seems that you need to be running Windows to
get additional features. (Actually, the ad I'm looking at looks like it
will do up 14.4, but you only get v.42/MNP2-5 with Windows.)

I have a P:R: Connection that I just bought from B & C Computervisions this year
and it works fine at 9600bps. However, 19.2KBps doesn't work at all.

> As for the augmentation of the macro language, what did you have
> in mind? It seems fine to me . . .

I've got the complete specs for my planned macro language written down somewhere... basically, it would allow you to execute ANY FlickerTerm function from within a macro (via a list of function numbers), call macro lines as subroutines, and load and run other macro files. The only real conditional would be a "wait for" command.

The basic idea is that, instead of hard-coding functions into Flick that may or may not get used, I
would provide the tools to implement whatever features the end user needs. You practically have to
do weird stuff like this when coding feature-rich programs in limited RAM (ever looked at
COBOL?).

Anyway, an autodial menu coded in this hypothetical macro language might look something like this:

```
1>%"Bob's Turbo Internet GateWay" atdt1-555-555-1234 %Jump 9 ^G password
stuff
... (other menu entries)
9>%Wait"CONNECT",30,9,99 %Return
```

BTW, the syntax for the Wait command is: TheStringItsWaitingFor, delay, timeout macro, found macro. "99" is a special case meaning "continue with execution of current macro".

#great character he is. I loved both of these games and having
#the chance
#to send a message to him would be great.

To Ron and others that sent me email. Here is the last email address
I had for Philip Price. This was as of 6/26/1995.

paradise@netcom.com

His post at that time was very encouraging. Basically he said that he
had tried to write games in his spare time, but that it didn't work for
him. He needed to work on them full time. The good news at that time
was that he was in the final stages of getting hired in as a lead
programmer at a game company (didn't say which one).

I have not noticed any further word from him on the subject here, but I
think he does monitor this group to some degree because he thanked
everyone who still talks about and plays his old games in this
newsgroup. Maybe a little email will encourage him to update his
current status for us here.

nolram; There just won't be a lot of ready made .ATR or .XFD images around. Its not a bad idea, but what I think there was kind of a consensus reached that this wouldn't happen on most sites. Problem is the files would probably have to be stored both as individual files as well as the .ATR! For example, why down load an entire disk full of files when you may just need one or two from the .ATR to complete your collection. It's fairly easy to make a big ATR image with individual files. If you are using the emulator, just use a MyDOS image and pass the list of files.
Rick

Hola ...
Yes, the Myutil! program in the Merit-umich archives (/diskutils/myutil.zip) contains 2 programs: Util, for MyDos 180K (SSDD) disks and sdatari for 180K spartaDos disks. you can use the Disk communicator program for transfer other formats to DCM to a 180K disk, use util or sdatari for store in th PC and then the DCM2DSK program for convert it to ATR format.

Regards.

[Some good reasons not to use ATRs at FTP sites - mainly because what if you only need a few files, and it's easy enough with emulators (both computer (ie PCXf, Rainbow, etc.) and peripheral (ie SIO2PC and APE) to get access to raw files anyway]

The main reason I see is, if you NEED to store it as a disk image (say it's a bootable magazine or game), not only is the DCM format SMALLER (because it's compressed), but it's easily turned into ATRs and it's STANDARD!
(Show me an ATR-to-floppy converter that is FOR the Atari!)

I don't know about Rainbow, but the emulator for Unix (and Amiga) can
be found at ftp.demon.co.uk:/pub/emulators/atari/.

Until I get a chance to put it on my Atari page, I have a link to it
on my resume (just off my main page).

w/ Championship Baseball overlay
manufactured by Milton Bradley

TRADES:

I am looking for R/ER/UR carts and a few U□s for
the Atari 2600 and Colecovision only!

HERE ARE THE RULES:

1. This auction will end on SUNDAY, DECEMBER 17, 1995
at Midnight Mountain Time unless there is still heavy bidding. If
so, the bidding will continue until the following Sunday at Midnight.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject should be JOLLY OLD BID.

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $8.00 and $15.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee, no warranty and no refunds
on anything purchased from this auction. Most of the
cartridges have been tested and do work the same goes
for many of the systems. However, cartridges for systems
which I do not own cannot be tested and neither can
systems which have no cables. If you are curious about the
condition of a label...ask.

10. I reserve the right to refuse bids.

11. I reserve the right to alter the rules or the auction itself.

12. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

12b. IN ADDITION, YOU WILL ALSO BE PLACED ON MY
DEADBEAT LIST. THIS IS A LIST THAT I HAVE BEEN
COMPILING REGARDING DEALS WHICH HAVE GONE
AWRY FOR ONE REASON OR ANOTHER. I INTEND TO
SEND COPIES TO ALL AUCTIONEERS ON THE INTERNET
IN AN EFFORT TO KEEP BIDDING HONEST.

Your participation in this auction signifies your consent
to follow these rules as stated.

: Since My 65xe is in no use condition(actually no room condition), I was
: wondering if there any image sites? Anyone placed PD/Share files on ATR
: formats?

My ftp site used to contain tons of ATR/XFD images, but it just became
too expensive to maintain it.

If you like, you can now dial into my BBS for these images at
801-969-1468.

Have you even acquired a working mux to try this on, or is it still a
"fantasy"?

I'd be happy to beta-test whatever it is you create on my MUX system. I
have 6 slaves.

3944. SPECIAL - Centronics Printer Interface

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-05 00:00:00 UTC
From: rmax99@ix.netcom.com
Message-ID: <4a0765$nff@cloner2.ix.netcom.com>
Source record: 87216

Special for Internet Customers only. We are offering our Supra MicroPrinter Centronics Interface for only $9.95 plus $6.00 shipping. This price is valid to all customers that either mention the "Internet" when ordering by phone, or who write "Internet" on their ordering letter. This interface will allow you to connect any standard Centronics printer to any model of Atari 8-bit computer. (The 1200XL requires easy internal modification, instructions included). This unit will word with any printer that has the standard 36 pin Centronics standard input connector.
American Techna-Vision also has a large number of parts / books and software at closeout prices. Please provide us with you name and street address for a free catalog.

To order your Supra MicroPrint Printer Interface for only $9.95 plus $6.00 shipping/handling (Calif. residents include 8 1/4% State Sales Tax) phone 510-352-3787 or FAX 510-352-9227. We accept Visa and Master Card.

To order by mail:

American Techna-Vision
15338 Inverness Street
San Leandro, Ca. 94579

regarding your inquiry about SIO2PC cables:

Steven J. Tucker recently proposed making a quantity of them and was
looking for responses from people potentially interested in buying them.
Contact him at: DH395@cleveland.freenet.edu, or at: classics@nacs.net.

>like an Atari 2600 (or 8 bit using the TV output) to one
>of these types of monitors with all the RCA inputs. Anyone
>know?

Depends on what you mean by "...all the RCA inputs." Just because a particular type of connector is used, doesn't necessarily tell us anything about the type of signal the monitor requires/expects on that line.

You can connect (I have connected) an Atari 2600 to a "composite video" monitor with a bare minimum of work; it would take considerably MORE work to connect a 2600 to a true "RGB" monitor. I consider it POSSIBLE that you're speaking of a "composite video" monitor even though you say "RGB" (below) because, in my early days, I, too, referred to anything other than a TV set as an "RGB monitor." One fairly good way to tell: if you have a VCR with "video out" (NOT "RF out") jack, try connecting from that jack of the VCR, to one or another of the RCA jacks on the monitor. If you get a reasonably "normal" TV picture, you're dealing with a composite video monitor and can hook up the 2600 -- one trivial way would be to leave the VCR connected to the monitor, and hook the 2600 up to the VCR's "antenna" or "cable" input, just as you would to a TV. Tune the VCR to channel 3 or 4 (or whatever it is that the 2600 puts out), and voila.

For what it's worth, the process of connecting the 2600 DIRECTLY to a composite-video monitor, without an intermediate VCR (tuner), involves tapping into the 2600's video and audio signals "upstream" of their entry into the "RF modulator" stage which places them onto a television carrier wave. Alas, it's been a LONG time since I did this, I did not write down any of the details, and would have to reverse-engineer the procedure if I wanted to do it again. I can only encourage you by telling you that yes, it's possible. Perhaps you, or a friend, have sufficient electrical/electronic experience to figure it out from this description. My own education was long on basic theory but short on specific hands-on details, and I managed it. Give it a try, especially if you've got more than ONE 2600 and can afford to smoke one if worse comes to worst. :-)

>Is there a way to hook what's meant to go into a
>TV switchbox to an RGB connector?

Not directly. A TV station combines audio (sound) and video (picture) signals, impresses ("modulates") the combined signals onto what amounts to a radio wave (even if you have cable) and transmits that wave to you. Your TV is designed to reverse that process: "demodulate" the radio wave, extract and separate the audio and video signals, and direct each of them to the proper

output mechanism (audio to the speaker(s), video to the display). The Atari 2600 was designed to take advantage of this already existing system. It acts like a miniature TV station, combining sound and picture onto a low-power radio wave ("RF carrier") equivalent to TV channel 3 or 4. This is what you connect to the "TV switchbox;" the switchbox merely matches up the electrical characteristics of the "directly connected" 2600, to what the TV expects of its "antenna" (or "cable"), so that it all works efficiently. A "composite video" monitor is like a TV without the part that demodulates the broadcast wave; you connect the audio and video signals, already separated (or simply never combined!), more-or-less directly to the speaker and display mechanisms. Hopefully it is clear that if you could grab the audio and video signals from the 2600 "upstream" of the combine-and-modulate operation, you could feed them directly to the audio and video jacks of a composite-video monitor.

An RGB monitor eliminates even MORE of the original TV set. "Composite" video is called that, because it carries all the colors in ONE "video" signal. It's actually Red, Green, and Blue signals COMBINED, i.e. into a "composite" signal, hence the name. The portion of the TV (and the "composite video" monitor) that "directs the video signal to the display," actually has to further separate the composite-video signal back into Red, Green, and Blue and send them to the correct parts of the screen! Some computers and professional video equipment can actually output the Red, Green, and Blue signals separately, and an RGB monitor permits you to -- guess what -- connect these separate signals more-or-less directly to the screen circuits! It is highly unlikely that the R, G, and B signals are available separately in the Atari 2600; they're probably generated and combined into "composite video" inside one of the integrated circuit chips, prohibiting us from "getting at them." I could be wrong, but at the time the 2600 was made, there just weren't that many people out there with RGB monitors, so not too many manufacturers of consumer products bothered to make those signals available. C'est la vie!

Hope this helps. If nothing else, you now know more about monitors. :-)

3950. Announcement: Networked windowing system for Atari's

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-05 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <4a0l71$79l@nuke.csu.net>
Source record: 87222
Cross-posted to: comp.windows.x,comp.sys.atari.8bit

By Spring 1996, New Breed Software will release "MUX Window", a windowing system based on the X Window System.

Using a number of Atari 8-bits (400/800/XL/XE series) connected together in a Local Area Network with the "Multiplexer" ("MUX" for short) from Computer Software Services, this system presents a Client/Server scenario similar to X.

The existing software uses a networkless model (the Window Manager / Server are INCLUDEd within the Clients) and has proven to be most satisfactory (albeit quickly running low on free RAM!)

For more information and (currently out of data) source code (in Action!, an extremely fast, high level compiled language), please look here on the World Wide Web:

http://zippy.sonoma.edu/~kendrick/nbs/ados/

Note: This system is NOT emulating the X Window system. However, it would be relatively simple to replace the Window Manager / Server GUI with a program which intercepts MUX-Window calls, translates them to the X Window protocol, and sends them to an X Terminal. It would also be possible (not nearly as simple, or as useful) to set up a MUX Window WM/Server as an extremely scaled down X Terminal! Ah, but to dream. :)

Thank you.

3951. Re: old BASIC sound code

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-05 00:00:00 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <148490@cup.portal.com>
Source record: 87223

By the very purest of coincidences, I saw the opening message of this thread this afternoon -- and thought nothing of it --~~beyond "e~whew, good luck, buddy" -- then this evening was~~~found myself browsing a b~friend's oldtime Atari docs and discovering an article that may be the one you're thinking back to!

I see nothing here about the author "having worked on the movie TRON," but it IS a Creative Computing article with short BASIC routines for producig ~~ng varou~~ious sound effects "includig ~~ng bombs." To be cific, the ~~~~~~~~~~~~~~~specific, the sounds that are listed here are:
Percussive Sound g~Generator
~Doorbell
Telephone Bell
Alarm Bell
Explosion
American Siren
European Siren
Ticking Clock
Klaxon
Whistle and Bomb
Steam Whistele~~~le
Sawing Wod~od

Obviously I'm not gong~~ing to retype the entire article and listings unless we're pretty sure this is the one you want... Let me know via e<mail.~~~~~~~ e<~-mail...

>get additional features. (Actually, the ad I'm looking at looks like it
>will do up 14.4, but you only get v.42/MNP2-5 with Windows.)

The problem with the Sportster Si is that it's an "RPI" (Rockwell
Protocol Interface) modem, which means that it expects
error-correction and compression to be done in software. That means
that even in Windows, only a few programs will work with it correctly.
You'll probably have bad luck trying to get it to go any faster than
9600 (you'll probably see lots of char 127).

I'd recommend replacing it with a non-RPI modem if at all possible.
From what I've seen, though, you still should be able to go 9600...

Yes, you can poke the ports for output also. I don't think they can drive
too much current so you would want to have them drive a transisitor
to boost the signal.

3959. Split-Video Cables

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: b.poehland@genie.com
Message-ID: <199512060532.AA282577939@relay1.geis.com>
Source record: 87231

The mutiple-RCA terminated cables sold by Radio Shack aren't compatible with the pinout of the Atari Luma-Chroma-Audio configuration. I bought one & modified it but found ultimately it wasn't worth the effort. The wire in those cables is unbelievably thin, it must be like #30AWG. I gave up using the modified Radio Shack cable after it broke a few times & I got tired of repairing it.

If anyone is still looking for the original Atari-compatible cables, I have a few spares to sell for $6.50 each including postage in the USA. My cables have 4 RCA terminating plugs & are marked CV-AUDIO-LUMA-CHROMA. One of the RCA plugs is usually black so has no markings, but you can dope out what the black one is if the other 3 are marked. No two of these cabvles has the same color scheme, even ones that appaear to made by the same manufaacturer.

Hope this message gets thru. Looks the cs.utexas.edu gate went sour, I'm trying this cs.yale gate for the 1st time. Looks like there were a few changes in the newsgroup while I was away arranging funerals for my Mom. Never thought I'd see ATV here.... hiyah Ralph! :)

Hallo 8-bit friends... I need to know, what are some good FTP/Web sites
where I can get .gr9 or .pic pictures? I'm trying to find a bunch for the
XE Group's monthly report and, possibly, a web page for the XE Group.

Thanks for making such a complete answer to my question. :)
While that doesn't look like anything I'll ever use, don't let that stop
you. I was just curious what you planned for your already
more-than-adequate macro facility.

Hi there. Nice to see that someone is using VTEX. Sorry about the
address, as I have moved and haven't updated the version of VTEX
that is out and about. I know that there is at least one version
later than 1.3... it may be up to 2.0 (I haven't looked at the code
in a while, but I will get the latest together tonight and up-load
it to a server sometime tomorrow).

The new address is:

Larry Richardson
6043 Dairy Road
Baker, Fl 32531

Please, send any comments or suggestions on this program. If you didn't
register it... don't sweat it. I just want people to have a useful
piece of software. Also, I have a few other shareware items which
I may put on the server tomorrow.

Later,
Larry Richardson

I wonder if that program runs under SoftPC(ironic, using an emulator to
make images for another emulator).

3972. speech and screen access for Atari computers?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: tomr@CyberGate.COM
Message-ID: <4a56k8$sla@opal.CyberGate.COM>
Source record: 87244

Ok, my newsreader seems to be having problems posting to this group for some reason, let's see if they've fixed the problem. I am trying to find out if there are any speech synthesisers and/or screen access software for the old Atari 8 bit systems. I need such equipment and software because I am blind and must have at least the keyboard input and the screen output of simple utilities such as Dos speak. About ten years ago I tried to get an external synthesiser to work via an 850 interface module without too much success. Being in serious need of a talking system for college, i had to sell my Atari 800XL. Now that I do have a talking system, the urge to try this old project again has been revived. I've heard many rumors about speech synthesisers and software designed for the Atari, but have never been able to find or test any. If any of you have any info about this sort of thing, I'd appreciate knowing about it. I have a stock '800 at the moment, so whatever you know about needs to run on that. Thanks in advance.

3973. Update to Press Release

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: nkey@ixc.ixc.net
Message-ID: <Pine.3.89.9512062129.A5083-0100000@ixc>
Source record: 87245

UPDATE

December 6, 1995

To all ATARI 8-bit users who use SpartaDOS as their main disk operating system. My name is Nelson Nieves. I want to announce my intentions to support the ATARI 8-bit computer and users running SpartaDOS.

The programs are modeled after MS-DOS and Norton Utilities on the IBM platform.

Among the following programs in development are:

vUnErase - view and/or unerase deleted files or directories; recover partial deleted files to other disks or hard-drive partitions.

XCopy -- will use the extra 64k on 130XE computers for faster read and write operations; SpartaDOS 3.2x users will be able to take advantage of archival copies when used in combination with FAtr.

DeFrag -- a two part utility, defragmentor with a separate directory optimizer.

I have created a sample file (in ARC format), it contains full working versions of several of the programs that will be released commercially in mid 1996, a list of programs under development, and a questionnaire for you to fill in and mail back.

Thanks to Bill Kendrick the sample files, NNTOOLS.ARC and NNTOOLS.TXT, are now available on the Internet at FTP site:

atari.archive.umich.edu

atari/8bit/New

It will be moved by the keeper of the 8bit archives (Jody Lenn) when he gets a chance. A link to it should also be in "Newitems" at the same time that it is moved. I'm guessing it'll be put in the "Spartados" directory.

NNTOOLS.ARC should also be available on GEnie thanks to Jonathan Mordosky (ACUTE BBS) and BBSes across the U.S.

For those of you who cannot ftp or get the file from GEnie send $10.00 U.S. dollars for the sample file to:

Nelson Nieves, ATTN: ATARI 8-bit project, P.O. BOX 1702, Hatillo, PR 00659-1702

Let me know in which disk format:

[ ] ATARI 8-bit SpartaDOS
[ ] IBM 360k 5 1/4
[ ] IBM 1.2Mb 5 1/4
[ ] IBM 720k 3 1/2
[ ] IBM 1.44Mb 3 1/2

Questions? Call 1 (809) 820-3135. From 8 a.m. to 5 p.m. eastern standard time. Ask for Nelson.

3974. Paddle Control

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: halliwee@ts436.dyess.af.mil
Message-ID: <30C5C648@syrinx.dyess.af.mil>

Rick_Michael_Cortese@cup.portal.com sez:

> Norbert, I think either Popcorn or Burgers supported the paddle
controllers
> but I can't remember which one.
> Rick

There was also this really old game where you used the paddle controller to move a little stick around on the screen. I forget what exactly the game was... something about bouncing this tiny little square into a bunch of bigger squares and making them disappear? I could be wrong, it's been a while.

Anyone remember this?

>

Ahh, I remember several years ago I hooked up the Atari to
my monitor and I bet this is how I did it (vcr). The
monitor has a switch in the front to go from RGB to Composite
mode, which was useful on my Commodore 128 which used RGB
mode to do 80 columns. It's a pretty cool monitor that
has served me well for many years.

3977. need modem>1200 baud.

OK,
a while back I was able to buy...from this newsgroup...an atari sx-212
DIRECT contact modem...shortly there after in my increassingly need
to UPGRADE my dinosaur rather than be converted over....I bought an
ATARI 850...now my next problem is to obtain a suitable MODEM
and a real terminal program.
what all modems can I use through an atari 850 interface...and
does any1 know of one for sell and where I can contact a person about
buying one...I need a 9600-14.4 modem that I can use a vt100-mode KERMIT
terminal program or a term program with KERMIT protocols.
thanks in advance...

I have the following computer books
for sale, most are for the Atari
8-Bit line of computers.

Title; Author; Publisher; Description;
Price

6502 Assembly Language Subroutines;
Lance A. Leventhal & Winthrop
Saville; Osborne/McGraw Hill; Source
& Reference for Assembly Language
Routines;.....$5.00 U.S.

Advanced ATARI BASIC Tutorial; Robert
A. Peck; Computer Direct;...$7.50 U.S.

Advanced Programming Techniques for
your Atari. Including Graphics & Voice
Programs; Linda M. Schreiber; TAB
Books; Comes with 55 Type in Programs.
.....$5.00 U.S.

An Invitation to Programming 2:;
Atari; SoftWare Manual for Writing
Programs;.....$5.00 U.S.

Atari 400/800 DiskGuide; John Taylor &
David A. Wilson; Osborne/McGraw-Hill;
.....$5.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Referen/Minus front Cover;
.....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Reference;.....$5.00 U.S.

Atari Basic Reference Guide; Atari;
Quick Reference for Atari Basic.;
.....$7.50 U.S.

Atari Microsoft Basic Instruction
Manual; Atari; PhotoCopied and Bound
Manual;.....$5.00 U.S.

Atari Sound and Graphics; Herb Moore, Judy Lower, Bob Albrecht; Self Teaching Guide;.....$5.00 U.S.

Atari User's Guide; Mark Ellis, Robert Ellis & Larry Joel Goldstein; Brady Communicat Basic & Graphics for Atari 400/800/600XL/800XL/1200XL;$10.00 U.S.

Basic Atari Basic; James S. Coan & Richard Kushner; Hayden Book Comp Atari Basic Book for the 400, 800 and the XL Computers;.....$5.00 U.S.

Beyond Games. Systems SoftWare for your 6502 Personal Computer; Ken Skier; Byte Publishing;.....$7.50 U.S.

Bits, Bytes and Buzzwords; Mark Garetz; dilithium Press; Understanding Small Business Computers;...$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GAMES; COMPUTE! Books; Type in Game Listings with info on Developing your own Games!;.....$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GRAPHICS; COMPUTE! Books; Games, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

COMPUTE!'S SECOND BOOK OF ATARI GRAPHICS; COMPUTE! Books; Graphics, Utilities, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

Compute!'s First Book of Atari; Compute! Books;.....$5.00 U.S.

Compute!'s Third Book of Atari; Compute! Books; Games, utilities, tutorials, & other helpful info. XL Compatible.....$7.50 U.S.

Computers for Kids; Sally Greenwood Larsen; Creative Computing Press; ClassRoom proven manual that effectively and easily teaches children to operate and Program the Atari;.....$5.00 U.S.

The Creative Atari; Small, Small &
Blank; Creative Computing Press;
.....$5.00 U.S.

Disk Operating System II; Atari;
Reference Manual, 100 Pages;
.....$2.00 U.S.

DOS 3; Atari; An Introduction to DOS
3;.....$3.00 U.S.

Games Atari's Play; Hal Glicksman &
Kent Simon; DataMost; Learn
Programming the fun enjoyable way...
By Gaming! With several Type in
Listings;.....$5.00 U.S.

Gemini-10X/15X Users Manual; Star
Micronics,; Manual for Gemini
Printers;.....$10.00 U.S.

The Home Accountant; Continental Soft
PhotoCopied and Bound Manual;
.....$1.00 U.S.

The Home Filing Manager Users Guide;
Atari; SoftWare Manual/Users Guide;
.....$5.00 U.S.

The Home Filing Manager Users Guide;
Atari; PhotoCopied and Bound Manual;
.....$3.00 U.S.

HomePak; Russ Wetmore; Batteries
Included Manual for HomePak;
.....$5.00 U.S.

Inside Atari Basic; Bill Carris;
Reston Publishin A Fast, Fun and
Friendly Approach to the BASIC
Language!;.....$5.00 U.S.

Introduction to Computers and Data
Processing Shelly & Cashman; Anaheim
Publishi Class Room Text Book, not
necessarily about Atari Computers;
.....$3.00 U.S.

Machine Language for Beginners;
Richard Mansfield; COMPUTE! Books;
Personal Computer Machine Language
Programming for the Atari, VIC,
Apple, Commodore 64 and PET/CBM
Computers;.....$5.00 U.S.

Making it Count; Boeing Computer;
Student Manual/Introduction to
Computers & their Applications;
.....$3.00 U.S.

Mapping the Atari; Ian Chadwick;
COMPUTE! BOOKS; Comprehensive
sourcebook and memory guide for Atari
400/800;.....$5.00 U.S.

The Musical Atari; Hal Glicksman;
DataMost; Turn your Home Computer into
a Keyboard Organ;.....$7.50 U.S.

Music Construction Set; Will Harvey;
Electronic Arts; Just the Manual and
Reference Card;.....$5.00 U.S.

My First Alphabet; Atari; SoftWare
Reference;.....$3.00 U.S.

OS/A+; OSS; Manual for/Systems
Software for Apple and Atari
Computers;.....$5.00 U.S.

Paint; Alex Packer; Reston Publishing;
.....$5.00 U.S.

Program Design and Construction; David
A. Higgins; Prentice Hall In Book on
General Programming;.....$3.00 U.S.

Programmer's Reference Guide for the
Atari 400/800 Computers; David
Heiserman; SAMS; Good Reference;
.....$10.00 U.S.

User's Handbook to the 400/800
Computers; Jeffrey R. Weber & Stephen
J. Sczcecinski; Weber System's I Atari
Handbook;.....$5.00 U.S.

Your Atari Computer; Lon Poole with
Martin McNiff & Steven Cook;
Osborne/McGraw-H Guide to Atari
400/800 Personal Computers/
.....$5.00 U.S.

3981. TT with 19" monitor for sale cheap

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: Tom Thompson <tthompso@pcshs.com>
Message-ID: <4a58g6$in5@globe.indirect.com>
Source record: 87253

I have a TT with 4 meg of memory, a 19 inch monitor that I would love to sell before christmas. It has been sitting lonely for the last
several months waiting for someone to use it. No one does. This system is going cheap. If you are interested, leave e-mail to
tthompso@pcshs.com.

I have alot of software to send if you are willing to pay the freight. (ie. Pure C. many terminal programs and a list will be made for the
buyer of the system.)

I also have an old ST 520 1meg machine, with mono monitor.

leave e-mail to tthompso@pcshs.com

3982. Re: Pooldisk CD Rom is AMAZING

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-06 00:00:00 UTC
From: bernard@twilight.xs4all.nl
Message-ID: <bernard.0700@twilight.xs4all.nl>
Source record: 87254

Hello Drake,

In a message of 05 Dec 95 Drake wrote to All:

>> Not to mention the THOUSTANDS of ATR images! Wow! Great job on the
>> CD!!

DTP> OK OK! Where can we order this Pooldisk CD from??

*** Area: COMP.SYS.ATARI.8BIT Date: 2 Nov 95 2:49:53
*** From: "ernest.r.schreurs"
*** To : All
*** Subj: 2000 ATR PD/Shareware images for use w

From: "Ernest.R.Schreurs" <ernest@pi.net>

We are happy to announce the availability of the "POOLDISK" CD-rom
for the Atari XL/XE computer. This CD contains the contents of
over 2000 diskettes. Everything is stored in the ATR format as used
by SIO2PC and APE. This is also compatible with the format used by
the Xformer. There are some 250 Megabytes of ATR images on the CD.
To accomodate the Atari ST users, all images are also stored in the
XFD format as used by the ST-Xformer. This occupies another 250 Mb.
These disks include over 250 diskettes from ABBUC, and over 330 from
the BELLCOM PD library. There are also lots of disks from usergroups,
magazines and disk magazines. The Umich.edu 8-bit archive has also
been converted to the ATR format and is now stored in over 500 disk
image files. There are also some files not in ATR format on the disk,
for those that want to try and write an ISO-9660 driver for the XL/XE.
Until someone manages that, you need a PC or an Atari ST to act as
a server for your Classic Atari, or one of the emulators. The
remaining 100 meg of the CD is filled with 165 pictures from various
Atari 8-bit systems and peripherals. This CD is now available from us
for US $ 35, which includes shipping by the cheapest possible rate,
which may take over two weeks. Send a check drawn on an US bank to:
Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands
Make checks payable to Ernest R. Schreurs. Do not fotget to mention
the mailing address, so we know where to send the CD to.
If you cannot send a check, US $ 35 in cash is acceptable too, but then
it is your own risk. If the money does not arrive, we will not know
that you sent any. If the check or the money gets here, we will ship
the CD as soon as possible. A few notes: some of the disks are in
German, Polish or Dutch. As far as we know, everything on the disk is

Public Domain or Shareware, except for the Pokey Magazines and the
Mega-Magazines, which are on the CD by permission, and are restricted
from further copying. You are responsible for whatever is copied off
the CD, if we accidentally placed anything on the CD that is not PD.
If the Jewel box cracks during shipping, this is your own risk. After
all, a new one costs under $1.
If you have any questions, send an E-mail to ernest@pi.net

END of message...

I hope this will help you....

3983. SIO2PC 4.04 posted

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <4a5d68$a6r@dartvax.dartmouth.edu>
Source record: 87255

The latest version of SIO2PC is now in the /New directory at the UMich archive. Look for sio404.zip there or in the Sio2pc directory (as if they'll ever get to cleaning out the uploads).

Because people sometimes have trouble getting through to UMich, I've also placed it in my own archive for the time being:
ftp://ftp.cs.dartmouth.edu/pub/crow/atari/sio404.zip

I understand that this software is shareware, so be sure to read the copyright notice before using it.

3985. PC Xformer

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <120795184848Rnf0.79b6@stingray.manawatu.gen.nz>
Source record: 87257

Please could someone tell me how I can order PC Xformer (the latest version), as I tried the web page for Brasoft (thanks Bill for the addy), and e-mailed them, but haven't received a reply. I'm _really_ wanting to get this for my mother for Christmas, and want to be able to order it over the net (as snail mail will take too long).

I had a look in the Toad Computer's web page, and couldn't find Xformer there, so I'm at a loss to how I can order this thing.

Richard.

3986. Atari Slipping?.....

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: germbear@aol.com
Message-ID: <4a718e$nrb@newsbf02.news.aol.com>
Source record: 87258

Questions for the group:

1. Will Atari ever update its WWW? New Releases only include the last (and only) 2 CD titles. No Missle Command, etc... What does this mean?

2. Why can't Atari get software out on time? This is a real disappointment. NOBODY will give a care about the Jaguar after x-mas. Even Atari admits that the 4th qtr is the strongest selling season and they can't even get software out the door. Don't get me wrong, there is new software out, but we need some software with recognizable titles to pull in new people (Myst, Primal Rage, NBA Jam TE, etc). Most people aren't going to go and buy a Jaguar for Kasumi Ninja.

3. Related to #2. Why are 3-rd party developers so slow coming out with software? I mean I don't see the Saturn and Playstation hurting for new exiciting titles. Has Atari (aka Tramiel boys) burned so many bridges that the Acclaims, EA, and other MAJOR houses don't care about releasing titles for the Jag? Atari sure had a bunch of people signed up to produce games and what has happend? Just a trickle of software. What kind of agreement does Atari have with these houses? Are the developers on the hook for anything if they don't develop software for the Jag? How are the agreements Atari has with developers compare to Sega, 3DO, and Sony? It would seem to me that we are looking for a few killer apps and there is a gold mine if someone like EA would come out with something really great. Perhaps this is NBA Jam TE by Acclaim, I don't know.

4. Why has it taken Atari over 5 years to come out with the Jag? And only 35+ titels? This is a JOKE. I've looked back at my Atari annual reports and the Jaguar was mentioned as early as 1990. GIVE ME A BREAK!!!! IF they would have released the system 3 years ago insted of sitting on their butts, we may have a chance. BTW, they also had $$ back then and not have to rely on selling stock to SEGA. Did it really take that long to develop? How long has SONY worked on their system?

5. Why is the LYNX dead? This is a great system. Oh I forgot no software (actually there are a number of titles, just not readily available to the public unless you call Atari, YIPPEE what about STORES people!!!!!)

6. How can Atari screw up everything they do in terms of launching a system? From the Lynx to the Jag it is pathetic. I look at Sony and see not only QUALITY software but I see great add ones (different contollers, mice, memory card). No delays. What the hell is up Atari? Look to the market leaders for help.

7. I shudder to think what will happen when the Ultra 64 is released. Say what you will, but there will be a lot of software support and for a rumored $250, watch out Jag.

8. My next note will concentrate on how Atari screwed up the ST market. BTW I spent a great number of years in Germany and Atari ruled!! Ads, endorsment, etc. Then I come to the U.S. and have to look under a rock to find an ST dealer. And this was in the hey day of the ST.

I have been a LOYAL ATARI fan. I've owned stock, an 800, 130XE, ST and now LYNX and Jag. I read over the past annual reports and it actually makes me sick to see the great potential go down the toilet because of piss poor managment. It's a joke and I'm sure that Atari will become a great case study for what not to do when you have your own company.

Thanks for allowing me to vent. Don't give up on Atari but we need to make sure we keep kicking the Tramiels in the ass and wake them up.

Garry Terrell

P.S. What ever happend to .....The Transputer Workstations, Portfolio, Atari PC line and many, many other?

3987. FS/T: Atari 8-bit items [12/07/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <4a76cn$bql@ixnews5.ix.netcom.com>
Source record: 87259

updated 12/07/95

I have the following Atari 8-bit software and hardware for sale or trade.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Postal Service. The shipping cost depends on both the weight of the package and the distance that it is traveling. Buyer has the choice of either first class or parcel post (which is slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless specified.

NOTE: Since all cartridges are used, some labels will have small defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 6.00 Atariwriter
$ 6.00 Basic
$ 7.50 Eastern Front: 1941
$ 5.00 Pac-Man
$ 5.00 Star Raiders

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM

and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with
it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply.

I will also throw in a second non-working ATARI 600XL for parts, FREE.

This is a complete system, except for RF switchbox and RCA cable.

$24.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox and RCA cable.

$44.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply.

This is a complete system, except for RF switchbox and RCA cable.

$34.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply.

This is a complete system, except for RF switchbox and RCA cable.

$59.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

Hi! Looking for some help in a few questions. If you can help, please
let me know. Thanks in advance! Ok, here we go:

1. Need to know if anyone knows how to get multiple disks into one .ATR file
2. Has anybody got AR:TC or AR:TD to work on the PC? Does anybody know the
procedure to get these to run? (I have the original disks)
3. Has anybody got Leaderboard Golf to work on the PC?
4. Has anybody got a modem to work with PCXformer? I have tried using
several R: handlers and cannot get it to recognize my modem (14,400 BPS)
5. Are there any hardened AR players out there who remember how to get to
the guild in the city that gives you both strength and wisdom? I
know it involves going through the maze, I just forget how many to
go before I have to turn, etc.
6. Anybody know how to get to the second gate in AR (not the floating gate)
7. Has anybody made any hacks or other programs for AR beside the CITY and
The dungeon?

Well, that's all of them. Please help me out if you can (especially the
R handler and AR questions). Please also note that I would like to found a
"Alternate Reality" section within this group to trade secrets, characters,
good stories, or whatever. Well, got to go. Thanks again.

3993. Atari 800 crash

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: tbauer@saul6.u.washington.edu
Message-ID: <4a7cqt$2hg@nntp5.u.washington.edu>
Source record: 87265

Hi,

I just picked up an Atari 800 and was trying it out. It appears to work fine with Star Raiders, Moon Patrol, but when I tried Basic, it kind of crashed. If I type anything, then press RETURN, it "freezes" and not even can I reset it by using system reset. I thought maybe there was a bug with the Basic cartridge, but it works fine an a 400. Also curiously, without any cartridge, the straight memo pad works fine, so obviously it isn't the return key's fault.

So I am kind of assuming that there could be a problem with the 10K OS "board" ??

Thanks for any help or advice.

Later,

Tom

3996. Super Pac-Man from B&C

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-07 00:00:00 UTC
From: kendrick@cs.sonoma.edu
Message-ID: <199512080201.SAA21338@zippy.sonoma.edu>
Source record: 87268

I just called B&C _right_ after reading Michael Current's comp.sys.atari.8bit post regarding his purchase of Berserk and Super Pac-Man (which was _never_ released!) from B&C ComputerVisions.

They are currently out, but are _producing_ the prototypes of this (and other noncopyrighted games such as "Deflector" and "Tower Toppler" (I believe that's what the lady on the phone said)) so theoretically they have an unlimited supply. (!?)

The price for Super Pac-Man is $14.95 (ouch, but probably worth it) and shipping is $6.00.

To reitterate the address (although it's a FAQ info), it's:

B&C ComputerVisions
1725 De La Cruz Blvd Ste 7
Santa Clara CA 95050-3011 USA
tel: (408) 986-9960 Phone Orders Tue-Fri 10AM-6PM

>to run on that. Thanks in advance.

I cannot direct you to existing applications doing all that you need. However, the speech synthesis software needed to produce such things has long been available. I think somebody did a talking terminal program, but I'm not sure of that.

A very complete and professional-level synthesis package was called S.A.M., for Software Automatic Mouth. One of its options was a speech device driver which would translate any text into a phonetic reading into speech. This was actually pretty understandable, but words like "laugh" would come out pretty strange, as it is not spelled like it sounds. As I recall, the easiest to use driver for S.A.M. was published in Antic or Analog magazine. It was called the V: driver, I believe.

Anyway, this software could easily have been used to do all that you need by any decent programmer. I just don't know if it was ever done, or if it was where you could find it now.

>that long to develop? How long has SONY worked on their system?

Probably because Atari had other interests, i.e. their computer line, which they gave up support on for the Jaguar.

Sony has been developing their system for close to 2 years. But I suspect they have been waiting, planning, and predicting the right time to release it.

>6. How can Atari screw up everything they do in terms of launching a
>system? From the Lynx to the Jag it is pathetic. I look at Sony and see

Marketing is top notch at Atari. It always has been. (Note: this is supposed to be sarcastic).

>8. My next note will concentrate on how Atari screwed up the ST market.
>BTW I spent a great number of years in Germany and Atari ruled!! Ads,
>endorsment, etc. Then I come to the U.S. and have to look under a rock to

Well they didn't do any better than Amiga, that is for sure. But most of the small computer companies that are not Mac or PC are gone.

>Thanks for allowing me to vent. Don't give up on Atari but we need to
>make sure we keep kicking the Tramiels in the ass and wake them up.

Oh yeah, let's talk about them, too.

It's too bad for a few years the younger Tramiel was running the business and decided to take it for a nose dive into the ground, that sure didn't help. <grin>

Do this:

C:\> XFORMER DOS.ATR ATARI.OBJ

viola - now you can run it ([L]oad D2:ATARI.OBJ), copy it to disk images
([C]opy D2:ATARI.OBJ,D1:), etc.

Or, you can get AtarImg or S2PC and copy the files to/from the disk images.
But I find it far easier to see all of my loose executables (say, games)
on my HD than to load up disk images and search through them (that is,
until I wrote File Selector... damn :) Should have never split up that
GAMES.ATR disk! :( )

Good luck

I accidently ran across some Atari info on the Web while looking for something entirely different. I was excited to see there was an emulator for the old 8-bits! What really suprised me was the release date was just a couple of days before I found it!

I have tried it and love it. I am going to pull the 8-bit out of the shed (please forgive me, sometime I know not what or why I do) and power that baby up. This is bringing back some good old memories! I ran a BBS in '83?? to '85 called Diskwiz and was the first to run it on a 835 modem, thanks for Jim Steinberger or Steinbrecker (something like that). He wrote the driver and I modified some BBS software. The good ol' days. Anyone remember that? 300 baud! Gotta love it.

Anyway, I might be way off topic here and I know some people have to pay for this, but just thought I would leave some positive feedback. I am going to build a SIO2PC cable also. I am looking forward to getting out my old software and seeing what and how things will work on the PC. Thanks to all who have kept the spirit alive! I am 27 and it has been about 10 years since I have been active in the 8-bit world.

It's been a while since I read about the 68000, but as I remember it
(an operation that's becoming increasingly perilous) the really good
part the 68000 family is the flat address space, but that's balanced by
a lack of segmentation, which comes in handy when the OS needs to move
stuff around in memory to consolidate free memory.
The Mac OS makes (made?) heavy use of program counter relative
instructions to make moving code around easier. These PC relative
instructions were limited to a 16 bit offset (an analogue of the 6502
branch instructions, whose 8 bit offsets cannot span the address space).

In article <4a56k8$sla@opal.cybergate.com>,
Tom Randall <tomr@CyberGate.COM> wrote:

[That he needs speech output from an Atari under such places as plain DOS]

Well - getting DOS to talk will be a difficult task. There are speech synthesizers out there. From "Sam" (Software Automated Mouth) to some hardware ones (I can't remember their names). I'm not sure that SAM is Public Domain or not, though.

Now that I think of it, I suppose a speech chip could be connected to the Atari via joystick ports (there was an old magazine article on it; however the chip involved was from Radio Shack and was discontinued ages ago <frown>). The "E:" (editor) device handler could be rewritten to send output to this device (or, if you had a better machine with more RAM, I'm sure a transparent software-only synthesizer could be created and used).

This way, all programs which worked happily with the "E:" device would be able to talk.

What type of software (other than DOS - that's not interesting!) were you planning on using?

Good luck!

> 2. Why can't Atari get software out on time? This is a real

Why can't Microsoft get software out on time?

> pull in new people (Myst, Primal Rage, NBA Jam TE, etc). Most people
> aren't going to go and buy a Jaguar for Kasumi Ninja.

No, but they might buy a Jaguar for Ultra Vortek (or DoomIronSoldier
Tempest2000AlienVsPredatorValD'IsereRaymanNBAJam:TEPrimalRageHighlander)

> 3. Related to #2. Why are 3-rd party developers so slow coming out with
> software? I mean I don't see the Saturn and Playstation hurting for new

Because the Saturn and Playstation are perceived as a higher priority.

> 4. Why has it taken Atari over 5 years to come out with the Jag? And
> only 35+ titels? This is a JOKE. I've looked back at my Atari annual
> reports and the Jaguar was mentioned as early as 1990. GIVE ME A

Manned missions to the moon were mentioned as early as the 1800s.
Your point?

> BREAK!!!! IF they would have released the system 3 years ago insted of
> sitting on their butts, we may have a chance. BTW, they also had $$ back

Yeah, and if they had released the system TEN years ago they would have
taken
over the industry! Again, your point? Just because something exists in
concept doesn't mean it's ready for release.

> then and not have to rely on selling stock to SEGA. Did it really take

The stock sale was a virtually insignificant sidebar to the $90 million Sega
paid Atari for use of their portfolio of videogame patents.

> that long to develop? How long has SONY worked on their system?

The PSX started life as the SNES CD, which was announced so long ago that
hardly anybody even remembers it anymore.

> 5. Why is the LYNX dead? This is a great system. Oh I forgot no

Dead? Hmmm... funny, I just got copies of Super Asteroids/Missile Command
and BattleZone 2000 for my Lynx, and they're both (C) 1995.

> software (actually there are a number of titles, just not readily
> available to the public unless you call Atari, YIPPEE what about STORES
> people!!!!!)

Ever heard of VENTURE?

> 6. How can Atari screw up everything they do in terms of launching a
> system? From the Lynx to the Jag it is pathetic. I look at Sony and see

They're screwing up far less this time around than in the past. That
they've
achieved the market penetration they have, from where they *were*, is a
bloody
miracle.

> 7. I shudder to think what will happen when the Ultra 64 is released.

Yeah, people will look at the $100 cartridges and say, "I don't THINK so!"

> 8. My next note will concentrate on how Atari screwed up the ST market.

Please, spare us. This is the EIGHT BIT Atari newsgroup. This entire
message
belongs in the Jaguar mailing list (jaguar@bucknell.edu). If you have an
ST diatribe all scribbled down, please direct it to the ST newsgroup.

> Thanks for allowing me to vent. Don't give up on Atari but we need to
> make sure we keep kicking the Tramiels in the ass and wake them up.

It's not as if we had a choice in the matter. You are aware, aren't you,
that
it's individuals such as yourself who give AOL'ers a bad name? Tell you
what...
before you go posting to any more newsgroups, go out and buy yourself a book
on nettiquette. Then slap yourself silly with it.

- hi -

I have SIO2PC (an older version and the newest one out there too) and it doesn't seem to work with my pentium 90....i borrowed a laptop from work and of course it came right to life and worked fine.

Does anybody know why this might be happening? And how to cure it?

No, there is nothing wrong with my serial port. I can use an assortment of other devices with it fine.

-thanks in advance
-regards,
RMZ (bob)

The one difference between the 65802 and 65816. The 65816 will address
16Meg of memory while the 65802 will address only 64k memory.
The 65802 will not replace the 6502c in the XL/XE atari computers.
These cpu's were customized for atari, and several of the pins have
been changed.

General note to Clay Halliwell:

When developing your "Wait" macro, can you possibly make it possible to have SEVERAL conditions waited-for and branched-on? Something like:

```
%>Wait "CONNECT" %Jump Connected | "ERROR" %Jump Failed | "BUSY" %Jump Redial
%> [default behavior here]
```

I.e, you could wait on any of SEVERAL strings (heck, I'd like to wait on MORE than just incoming-serial strings; suppose I wanted to be able to "press OPTION to abort" in the middle of a macro?), and jump to the appropriate label BASED ON the event that actually occurred.

The lack of this feature is one of my biggest and longest-standing complaints about pretty much ALL existing terminal/comm software.

4014. Re: speech and screen access for Atari computers?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-08 00:00:00 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <148636@cup.portal.com>
Source record: 87286

Tom Somebody writes (a general question about speech and "screen access"
for the Atari 8-bit.

Tom, a commercial speech-synthesizer software package called
"S.A.M. - the Software Automated Mouth" came out in the early 80's for
the Atari 8-bit line. S.A.M. ("SAM," for short, to let your current
terminal say it better) will speak from either "plain English" text,
or special "phonetic" text. Speech quality is better if you do your
own translation into phonetics, but even plain-English speech is accept-
able and can be understood once you get used to it. SAM tends to sound
"nasal," as though he has a bad head cold. You can adjust the speed
and overall pitch of SAM's speech.

As I recall, the product included the speech-synthesis module itself, some
example BASIC programs which used it, and a manual including a table
showing all the phoneme codes acceptable in "phonetic" mode. As
shipped, BASIC programs accessed SAM by placing the text-to-be-spoken
into a character string named SAM$, and calling a machine-language entry
point (one for plain-English speech, a slightly different one for phonetic).
Someone later produced a simple public-domain device handler that let
you send text to SAM by PRINTing, which I expect could be adapted for
interfacing with many commercial products which normally output text to
P:, R: or D: devices.

SAM was a product of Don't Ask Software. Either they, or someone else,
later released at least one game (Poker SAM) which used SAM to provide
speech for game characters.

I myself used SAM to write a very simple, dumb-ASCII, "glass TTY" terminal
emulator, in Atari BASIC, which would buffer up a SAM$-string's-worth of text,
transmit a control-S to pause the host computer, speak the buffered text,
then transmit a control-Q to restart the host's transmission. I success-
fully used this program to "read me my e-mail" back in 1986 or so. I
may still have it somewhere, and may in fact have posted it HERE in the
past; I KNOW we've discussed this subject here before. I'd think it would
be a fairly straightforward project to combine SAM, possibly that third-
party "device handler," and a little ML code, to produce a program which
read the contents of, say, a simple GR.0 screen. Other text modes could
probably also be supported. Graphics modes -- what would you WANT as
output? SAM could at least say, "graphics here!"

I have no idea of the current availability of S.A.M. or of any other
software which used it, or of any other speech-synthesis utility for the
Atari 8-bit line. If anyone reading this knows more, please "speak up!"

I believe that is the name of the game. Any1 have information on this game? It seems to be a racing game or something. You can race in three different countries, and on the option screen you can adjust some kind of hill (what the heck is this? :).

The main racing has very good graphics and sound for the Atari. You have to dodge bouncing balls and flying triangles, and barriers dropped by a plane. It is a VERY difficult game. I can rarely get past one race, and never past two.

Can anyone tell me more about this game? I.e. more commands then just pushing up to speed up?

>The mutiple-RCA terminated cables sold by Radio Shack aren't compatible
>with the pinout of the Atari Luma-Chroma-Audio configuration. I bought
>one & modified it but found ultimately it wasn't worth the effort.

Interesting! I've used 5-pin-DIN-to-4-RCA-jack or -plug adapters and cables, from Radio Shack, for my Atari monitor needs for YEARS without noticing any particular incompatibility. On the other hand, it's been many years since I bought mine, and perhaps things have changed. The cables and adapters I bought are very "generic" -- each RCA plug or socket carries the signal from one of the DIN pins, and you simply use the plugs/sockets you need/want and ignore the rest. I assume, therefore, that YOU bought a more specific, more limited cable, that carried only SOME of the DIN pins out to plugs/sockets possibly pre-labeled as "video" and "audio," and that the pins THEY selected weren't the pins Atari uses. Is that what you're saying? If not, what was the problem? I haven't had any problems with MY cables or adapters. (It's also possible that I'm not as "particular" about the quality of my video signal as you are! ;-).)

>wire in those cables is unbelievably thin, it must be like #30AWG. I
>gave up using the modified Radio Shack cable after it broke a few times
>& I got tired of repairing it.

I've never had THAT happen either -- at least, not with the cables I'm using for my Atari video and audio. I HAVE had a RS "4-conductor RCA-plug-to-RCA-plug" cable "go bad" like that, though. I think I see what you're talking about... I conclude that RS has gone even fur-ther downhill in the last few years, than their already low position on the totem pole of quality when *I* was a kid.

>If anyone is still looking for the original Atari-compatible cables, I
>have a few spares to sell for $6.50 each including postage in the USA.

I have an ATR8000 but have had problems accessing 720K 5.25" floppies with it. The drives themselves are brand new and are made by Mitsubishi. I'm using SpartaDos and they format fine. But when I write to them they start getting errors when the drive is half full. It seems like they may be formatting 80 tracks but only using 40 when writing. The drive heads are writing at the ID of the disk when the drive is half full. I had a small file called TRACK80 or something like that. But it doesn't seem to make any difference if I use it or not.

I'd appreciate advice on solving this problem from anyone who has had experience with the ATR 8000. Especially anyone using 720K 5.25" drives successfully!

I didn't know they had a web site. I'm going to try to visit it today!
(Where do I want to go today? Atari's WWW site!!)

>5. Why is the LYNX dead? This is a great system. Oh I forgot no
>software (actually there are a number of titles, just not readily
>available to the public unless you call Atari, YIPPEE what about STORES
>people!!!!!)

Is Atari still producing it? I know that Toad Computers Web site
(www.toad.net) has tons of Lynx games, and I'll probably be ordering a
few after Christmas. I don't know why Atari doesn't hype the Lynx! Look
at the Game Boy, and how much hype it gets, and it is a pathetic
portable compared to a Lynx, which is only $10 more. Does anyone know
if they discontinued the idea of being able to use the Lynx for a
controller for the Jag? With the price of a Lynx around $60.00, this is
not too outrageous for a controller.

Atari is a case study any marketing major should look at to see what
not to do. I will list things that they did right (After the Tramiels
came in):

-Got the ST out the door in 18 months
-Released the XL and XE series in a timely matter
-Released the XE Game Machine and 7800

This is some of the hardware, unfortunately, once it got out the
door, there wasn't a whole lot of software produced for them!!!

Cross-posted to: rec.games.video.classic,alt.games.video.classic,comp.sys.atari.8bit,comp.sys.atari

I picked up a couple games for the Atari 400/800 at a thrift store the other day, still in the shrink wrap. The games were called "Princess and Frog" and "Fortune Hunter", both by Romox. "Princess and Frog" looks to be a clone of "Frogger", while "Fortune Hunter" appears to be suspiciously like "Venture". Does anyone know the rarity of these games and how much they're worth?

The Hill as you call it is (if I remember rightly) the 1st time a car handling control had been added that was totally adjustable by the user..Hold on Ill have a look at the manual.....

Yep thats what it was..1 firmest control, 3 lightest...

Also the game was the 1st (I think) multi choice split track ie you could choose a track to go down when the road split in two while racing.

Apart from that the only thing to watch is the countdown timer which tells you how far to the end of the track.

Have fun..Any other info give me a mail..

Paul.

... I am Locutus of Borg; your tagline will be assimilated!

I am looking for information concerning what software is available to
connect a friend's Atari to the usenet, ftp, www, etc. I apologize for
not knowing his model - I would like to surprise him. Could someone point
me in the right direction. I would appreciate this greatly.
Thanks
Stephen

>insted of sitting on their butts, we may have a chance.

Actually, it is just the opposite of this. Regardless of how long they worked on it, the system was released too soon, before it and the software base were fully mature. The hardware design was good enough to sit on for another year, during which time they could have made their initial product offering much higher quality. It would have also given 3rd party developers more time to learn the machine, so that the long wait for software would have been much shorter. Rushing things to market only hurt the machine, as sub-standard titles and small selection reduced the public's image of the machine, and did little to make the customers who actually did buy the machine happy.

I think Atari may have been concerned that 3DO would take the market away from them before they got the Jaguar out, and they wanted to get their foot in the door before it closed -- even if it was just one toe. They should have realized that 3DO would not sell at that price, and also that it is extremely difficult to hold a door open with just a toe.

It's also very possible that Atari simply did not have the money to wait any longer.

I cannot tell you how it runs the games you mentioned, since I have
not tried those myself. I can tell you though that the version 3.30
of the PC-Xformer that is available from Brasoft's web-page runs more
programs than any other version. It really works a lot better. I would
not be surprised if it would run those games too. You should get the
demo version and try it out for yourself. When the version for the
Xformer cable becomes available, testing these copy-protected disks will
also be possible. But untill that time, running copy-protected software
will not be possible, unless you happen to have a modified copy of the
games.

TR> Tom

I know of a couple of speech systems for the ATARI 6502 8-bit. Two
hardware devices are -- The Alien Voice Box, and The Co-Vox Voice Master
and the Co-Vox Voice Master Junior. There is also a software program known
as the Software Automatic Mouth, or S.A.M. Then there is the Parrot-2,
8-bit audio digitizer microphone sampler, and Richard Gore's Digi-Studio
music program. I have not had personal experience with any of these
products. I have tried the Co-Vox Voice Master demo disk. The demo disk
can say the numbers zero through nine and the letters ay through zee. I
suggested that someone who had access to any of these digitizers could
digitize the forty-four basic human phonemes -- a la the Texas Instruments
SPEAK-AND-SPELL(tm) -- and create a phoneme set that can be used for
speech. (I believe that S.A.M. already has this.) I believe that Tom Hunt
may have done exactly that. I don't know what he calls his phoneme set. I
think "Say It" springs to mind for some reason .... It should be possible
to design a simple text reader on the ATARI 6502 8-bit. I have no idea how
comprehensible the processed text would be, but it might be on the level of
programs such as mac-in-talk and pee-cee-speak. It might not be up to the
level of the Amiga Basic "say" command, though. That is all the meager
information that I can remember at this point.

HEY! WELCOME! I know exactly what you mean! I went through exactly
the same thing about a month ago. Got my 8-bit system re-setup right
here beside my PC! I am about to order the full Xformer and cables
and Pool CD..........

What a blast from the past. It really reminds me of how much the PC
turns us into slaves to software. On the old 8-bit I used to know it
inside out, did some Assembly programming etc. Now I find myself
unable to remember how I did any of it...

Oh well, I think that is what this discussion group is for!

P.S. Anyone got a copy of GORF or 7 Cities of Gold? My original copy
of 7CoG got destroyed! It was my favourite! I doubt I could get a
replacement from EA anymore! (Does GORF need the translator?)

The Atari Computer Enthusiasts of Columbus would like to extend an invitation to all to join us in our annual ATARI SWAP MEET. This event will be held Wednesday Dec. 13 7:30 - 9:30 at Chemical abstracts.

Interested in trying to unload some Atari hardware/software? Looking to see what others are trying to unload? Are you in close proximity to the Columbus area?

Then look no further.

Any questions? send email. Now promising fast responses :)

From: tbauer@saul2.u.washington.edu
Message-ID: <4adihu$ii1@nntp5.u.washington.edu>
Source record: 87162

Hi ,

I was wondering if someone could tell me if replacing a
c012399B-03 chip with a c012399B chip should affect the performance
or characteristics of an Atari 800 (that was why my system was
crashing). The other rom chips seem to be okay. It appears it is
an OS Rev B rom, but I'm not sure about the -03 part. Got the other
chip from my 400.

Thanks,

Tom

Message-ID: <mbates-1012951139500001@ppp2-stk.sonnet.com>
Source record: 87167

Just to add my two cents:

B & C is selling protype-looking versions of the following:

Tower Toppler (it is 98% finished and very playable. The 7800 version is
MUCH better, though)
Deflektor (cool game, is reviewed in an issue of Atari Explorer)
Superman III (ack, this one bites)
Berserk (EXCACTLY like the 5200 version)
Super Pac-Man (Best Electronics also has this cart)
Kangaroo (this one could be better)
Letter Tutor

They range in price from $14.95 to $24.95.

If anyone wants a more in-depth review please e-mail. I have all of them
except Letter Tutor.

-Marlin

4048. Do DSDD 96tpi disks work with 8bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-10 00:00:00 UTC
From: Mikael Andersson <ex94-mla@amanda.ies.luth.se>
Message-ID: <Pine.SUN.3.91.951210205143.7586A-100000@albyl.ies.luth.se>
Source record: 87170

I have come over a bunch of 5.25" disks with 96 tracks/inch.
I know that the 810 and 1050 diskdrives use disks with 48 TPI,but
they are not easily available any more and I got these new disks
cheap.
First I tried to copy one of my old disks to one of these new
disks with a program called super duper.I didn't use any verify.
The result I got was that only one of the five programs on the
disk worked. Then I tried to copy the disk with DOS 2.5 which uses
verify.The result I got this time was that all programs on the disk
worked. Do any of you have any experience with using such disks on
the atari ? Will these disks hold the data in the long run ?
Please post to this newsgroup,because their might be other people
on the net that have use of this information.

Regards,

Mikael

I was just about to ask you to upload it to umich, but I found it
there:
atari.archive.umich.edu:Graphics/picfmts.doc

Note that it's not in the 8bit hierarchy.

Now, does anyone know of a similar description of the common graphics
formats on the 8bit?

I got hold of Philip Price and he said he is going to start up the creation of games again. He also told me about some other projects he was doing in 3d boards for the PC. Sounds good. He is a really nice guy. He really appreciates all of the feedback that he gets from AR and he replies pretty quickly. If you would like to Email him, his new address is:

paradise@surf.com

Give him a buzz sometime and let him know that we still support him. Who knows, he may make something even better than AR in the future. Talk to everyone later.

.
I have been wondering if connecting the joystick ports on one computer with those on another computer (both Atari 8-bits, obviously) could be used for a simple, if crude, communication line? What I had in mind was something where two joystick cords (from broken joysticks, say) were wired together, and plugged into each computer's port. Is it that simple, or would more electronics be required?

Will

You said 'Works without Modification' . I don't understand this at all as the
Logic in the SIO2PC cable needs +5 Volts from the 1200XL. The only way to get this
is to go inside the 1200XL and short out or remove R63 and replace it with a jumper
wire. It was a 'Series Limiter' resistor put in only the 1200XL. Not of any use and had
to be remove to use a ICD P:R:C and many other third party products.

The Gargoyle/Riddler asked three questions. If you got them right, you got into a special area. If you went back and saw him again he asked you for his name. His name is SHINGOR. (Remember the Riddler on the TV Batman show?) If you do all this, you get a Pulse Rifle and 2 packs of ammo with 95 rounds each. You were supposed to learn his name in the "Wilderness" scenario and then come back through the Dungeon, pick up the Pulse Rifle, and then be able to waste any of the aliens running around on level 4, and of course the heavies that were waiting just as you inserted the "Revelation" scenario disk. Another cute trick is to go into a stairwell and type in Datasoft's phone number (I can't remember if you need the area code or a 1 in fron of it). If you do it, check your spell list, you should have the spell "Tac Nuke" at 95% which should waste anything including the BIG dragon. The only way to legitimately kill the BIG dragon is to get the spell "Temporal Fugue", I don't know which guild has it, but we probably set it up to be one of the Good ones. Practice this spell so you're really good at it. During combat it stops time for a couple of action rounds, giving you a excellent oportunity for critical hits on your opponent. When you fight the BIG dragon cast this spell until you are near Exhausted or at least Tired. Then pull out your special awesome weapon of choice and wail on it until it's dead. You

have about a 1/3 chance of pulling it off, but it can be done with a character at only 8th level. The final thing is to haul the dead dragon's carcass to the Tavern. You'll be encumbered and move at a snail's pace. But they will buy the carcass off you for meat, give you a bunch of money you probably won't need, and boost a couple of invisible personality and charisma stats way up.

I don't think Phil can help too much on Dungeon insights, since the programming, and design for it was done by Ken Jordan and myself. I think Phil wanted to know as little as he needed to, so that he would be able to enjoy playing it as well. Phil Price did provide the basic plot lines we followed, so that the overall story followed his vision, but he trusted the rest of it to us while he was off programming for the military.

It's amazing to see this game still talked about years later.

The game makes massive use of display interrupts for color. The copy protection used as scheme called weak bits or fuzzy sectors, where a special sector on the disk doesn't read the same way twice. The game does copy protection at two points. The first is naturally when the game loads. The second is when a game is saved. There is a 1/8th chance the game will decide to do a protection check when it saves to disk. If it fails, the saved game is marked so that it will automatically fail when the game is loaded. All parts of the game are written as overlays, and they were all encrypted and checksummed to reduce tampering. There were also two copies of the protection overlay on the disk, the second one was only used during game saves, and then only a small percentage of the time (a final gotcha for crackers). The copy protection was designed to foil home duplicators, memory snapshot boards(Once a game passed its copy check, all of memory was snapshotted to a special boot disk), and all but the best code crackers. I would be amazed if anyone could get it to work on an emulator, or even past the copy protection. I think only a cracked version would have a chance of working, and I never saw it cracked. I did see one outfit have a 6 disk snapshotted version, but it would have failed randomly on game saves. I doubt anyone would be upset by a cracked version these days.

Let me know if it works!

Please stop this, you two!
OK, Gaven made a mistake and crossposted somebody else's post.
Then in his apology, he shot some quite unnecessary flames.
Then Michael ignores the part where Gaven said he didn't even write
the thing, and continues flaming Gaven for the content of the original
post!

>32-bit -- complete garbage.

It's not such a big deal on Motorola CPU's how many 'bits' the OS is, because there aren't huge differences in capabilities between different generations of the 680x0. On the Intel, a 32 bit app can see all of memory contiguously, but a 16 bit app can only deal with 'segemnts' of 64K each, so it makes a HUGE difference in how the app will be written.

On the 680x0, only minor changes to a program make it 32 bit by using features not found on previous CPUs, but the programming model remains the same. How many 'bits' the OS is doesn't matter nearly as much to a Mac user who isn't having to deal with the limitations of old Intel CPUs.

I imagine the PPC version of Mac OS must be considered 32bit because there is no 16bit Power Mac, and no PPC CPU with 16bit limitations.

Are you sure you're emailing the right place? I answer email just about
every single morning. The correct email account to send email about
PC Xformer is: brasoft@halcyon.com

If your registration card was mailed in to us, and you correctly filled
out the password request on our web page, you should have access. If
not, contact me, don't bitch about it to people who can't help you.

Also available on Atari 8-bit as a cart (and probably disk as well), and
C-64 both disk and cart.

> Gaven, at least do some research before you show the world
> your IQ, ok?

I have been informed of this mistaken crosspost, and deleted it as soon
as I was informed of it.

The story goes like this:
1) A moron posts this into an inappropriate newsgroup
2) I hit (by accident) my "exit" hotkey - it was immediately next to my
"flame with extreme vengeance" hotkey.
3) "e" was an illegal keystroke in my newsreader.
4) "x" however, was translated into "Xpost".
5) I was given the opportunity to say yea/nay to each of the few dozen
(inappropriate) newsgroups it was crossposted to.
6) I believe that i had said "no" to all of them.
7) Someone, or something, goofed. It got (wrongly) crossposted.
8) The following day, when I logged on to my net host, I found a few
nastygrams from readers of csa8 informing me of how stupid/inappropriate the
post was.
9) Of this, only one had enough info in the message header to say that it
was from csa8. None of the nastygrammers mentioned _where_ the message
was found.
10) I killed the message in csa8.
11) I posted an apology to the csa8 newsgroup.

So, before you start flaming someone, make certain that it was an
intentional post, rather than an accidental Xpost.

If it interests you, I have owned two 8-bits between 1984 and 1986 (a
600XL and a 130XE). I now own a Mega ST [soon to be put out to pasture]
and a 20Mbyte TT.

So I _DO_ know my Motorola chips - and how crappy Intel chips are - and
why my next system will be a PPC system based around the 620 CPU.

Had I have wanted to start a flamewar, I'd have posted a lot better a
message than that crosspost. But, as you can see now, I didn't.

And a message for Michael Ellis:

In future, contact the author of a message such as the one you are criticising me of making. Often they are either unaware of the crosspost, or the actual newsgroups they should go into. In my case, I didn't know it had been Xposted into any groups.

Also, dont belittle others intelligence when you yourself may be shooting blanks in the same regard. (My intelligence frequently rates in the low-to-mid 200 IQ points. Your message shows that your IQ score is probably _many_ tens below that. I am certainly not swayed from that opinion by your University Of Florida email address - I have met many dolts with university email accounts - that phenomena is global)

4069. Transfer 8-bit to PC - how?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-11 00:00:00 UTC
From: siano@cceb.med.upenn.edu
Message-ID: <4ag47c$8n8@netnews.upenn.edu>
Source record: 87183

Okay, the story's simple. I have lots of old text files on my
8-bit disks, and I'd really like to transfer them to my PC with as
little fuss and bother as I can muster. I've got the old 850
interface, so hooking my 8-bit into my PC's serial port isn't a
problem.

Any suggestions on how to handle the transfer? Is there
software that'll enable me to simply send the materials by null modem?

Replies by Email, please.

I am looking for a NEW or MINT Atari XE Game System to add to my classic collection. I am interested in the console, the gun, the keyboard, and the XE joystick!

Does anyone know of a place that sells these new? (Maybe they have some laying around)....

If you have one, please make sure it has box, docs, and is in great shape and send me some email!

Thanks!

BTW, I am also looking for a Sega Master System Multi-AV cable (give you the composite and AV cables from the unit)... thanks again!

Make sure you have the latest version from:
ftp://ftp.demon.co.uk/pub/emulators/atari/ before compiling
(0.2.1). I've copied it into /New at UMich, as well. I found it
compiled fine under gcc 2.7.0. If you have problems, send me email
and I'll help you out or provide an ELF binary. (I'm running it under
X; I haven't tried it with SVGAlib.)

As to the emulator, I find it works quite well, though it dies on a
number of programs that use unofficial opcodes, as they haven't been
implemented yet. There are also problems with vertical scrolling, and
some programs don't display with the correct colors (Ultima IV, for
example).

I've had some troubles with BobTerm. A friend who knows the
old Atai pretty well brought over his copy, and wouldn't ya know, it
doesn't seem to work on my old Atari 800. We've been talking about my
borrowing his 130XE or later model, but nothing's come of it.

I'd like to suggest a strategy that perhaps some enterprising
programmer could follow. It seems that there is a substantial problem
in getting the PC to interface properly with the Atari disk drives.
Would it be possible to work up a program for the Atari that would
allow th PC to use the Atari as a kind of interface to the original
disk drives?

Think of it this way. You plug a serial cable between the PC
and the Atari interface, and load up the software on both systems. The
software puts the Atari into a kind of "slave" mode, where the PC use
can send a simple set of commands to the Atari: send file, receive
file, disk directory, etc. There could be some kind of error checking
protocol incorporated, and perhaps a rudimentary translation utility
that would convert Atari's idiosyncratic ASCII into standard ASCII.

Has anyone tried to work up something like this?

4076. SIO2PC 74LS00 version problem with 1200XL?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-11 00:00:00 UTC
From: <>
Message-ID: <4ahoce$pem@gaia.ns.utk.edu>
Source record: 87190

I pulled out all of my old Atari equipment over the weekend and everything seems to be working ok! I decided to build a SIO2PC cable so I could start backing up my old floppies to my PC hard drive.

I found a document in the APE zip file that had a version of the cable using parts I had laying around my workshop. I built it and tried it and got nothing. I decided to try a 74HCT00 after reading a little comment in the document about it working with a 1200XL with no mods. I had NO idea what was meant by this as it was a personal note to someone I guess. I tried the HCT chip and now I see some life.

If I boot with the 1050 drive, I can see the status line in the SIO2PC program and it seems to be working fine, however, if I try to boot with my PC hard drive, the Atari doesn't see it at all. I tried this with APE and got the same results. My Atari will not read the ramdisks I set up in either program.

Has anyone built this version cable and had this problem? Is there something I can try? Is there a problem with the 1200XL using it? Do I need to build the harder to find parts version :)?

Thanks,
Don (dperuski@utk.edu)

Hello! To all those who have tried to e-mail me or are wondering why I've taken an unusualy amount of time to reply to a c.s.a.8 post, I have a perfectly valid excuse: the main machine I use at school died (literally!) - it's hard drive (which was, after its purchase, rumored to be quite unreliable) overheated and killed itself! So, although I still have an account on this machine (vax@sonoma), its e-mail (if I even GET any) gets auto-forwarded to my favorite (Unix) machine (zippy@sonoma).

So - if you get bounced mail, if I never reply within the next week, please try mailing again once I give the all-clear. :)

Sorry!

-bill! (still working on MUX Window!)

4082. How To Upgrade to PC Xformer 3.3 For Dummies Vol. 1

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-11 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <4aigbq$9mb@news1.halcyon.com>
Source record: 87196

It would seem a lot of people are having problems with what should be a rather trivial exercise. I've read several posts today from people claiming that a) their email to Branch Always Software goes unanswered, and b) their attempt to download the PC Xformer 3.3 upgrade from our web page fails.

Given that I reply to about 20 or 30 pieces of email each day, it seems there are those people who are mailing the right place and those that are not. The correct email address for Branch Always Software is:

brasoft@halcyon.com

This has been our email address for most of the year and will continue to be for some time to come. IF YOU ARE NOT SENDING EMAIL TO THIS ACCOUNT, YOU WILL NOT RECEIVE A REPLY. Do not send email to our old America Online or Compuserve accounts. I terminated those months ago and mail sent to those old accounts goes into a black hole. America Online, being the assholes they are, keep the account around and don't send email back to the sender to indicate that the account is terminated. This is probably the most common cause of unresponded to email.

To upgrade to PC Xformer 3.3 over the Internet, you simply need to do two things. Mail in the Product Registration Card that came with your PC Xformer package. Most people forget to do that. Second, browse our web page and fill out a comment form and request access to the registered users download section. In this form, you must include your full name and mailing address as it appeared on your registration card, plus you must specify a one word USERID and one word PASSWORD to use. It's very much like logging in to Unix itself. Once you send the form, you will have download access within a day or two. That's all you need to do.

Common reasons why people don't get granted access: they are not registered users, they did not specify a userid or password, or they specify a multiple word userid or password.

If you do not already own PC Xformer 3.0 or higher, you obviously can't upgrade online. You need to purchase the product first. To purchase PC Xformer, you go to an Atari dealer such as Toad Computers here in the U.S., Micro Discount in England, or KE-Soft in Germany, or the ABBUC user group in Germany, and order PC Xformer 3.3 for $34.95. Then mail in the registration card and follow the directions already described.

This isn't rocket science folks! In order to avoid forcing everyone to mail money in and wait to receive upgrades to PC Xformer, I am making available this online method of upgrading. From the messages I'm

reading, and the bogus comment forms I've received so far, it would seem that this may be too challenging for some people. Either they can't read English, or they are simply idiots, I don't know. But in any case, if people are finding it too difficult to upgrade online, then for future PC Xformer upgrades we'll go back to the "old" way of doing things using snail mail.

For those who can't find their way around the Internet, snail mail upgrade notices for PC Xformer 3.3 as well as for the PC Xformer Cable are going to be mailed out to all registered users of PC Xformer in the next few weeks and you will have the option to upgrade by snail mail. Watch your mailboxes in early January.

>to image files..thanks

Why are you trying to covert them? PC Xformer runs .OBJ files directly
so you don't need to convert the files to disk images first. You can
use PC Xformer to do the conversion from an OBJ file to disk image
so no additional utility is required.

Download the PC Xformer 3.3 demo (the latest one) from
http://www.halcyon.com/brasoft/ or order the real product from either
us directly by calling 206-236-0540 or from Toad Computers at
1-800-448-TOAD.

(Clay Haliwell (author of Flickerterm 80, or is that Earl.) talks about
1k xmodem batch being a good description of y-modem batch.)
I hope someone has been doing some null modem, sio2pc or ape transfers
using BobTerm. The real question here in this thread is does BobTerm
so called y-modem batch work properly with various flavors of today's
y-modem, which are all based, (HELP ME IF YOU KNOW) on Chuck
Forseberg's y-modem g (a batch protocol). I remember reading in DSZ
docs (DSZ is Forseberg's z-modem and y-modem package) that there are a
number of 'y-modem' implementations. Y-modem -g of DSZ is, I am really
almost sure here, not like 1k xmodem batch.
The whole point is, as Steve Tucker seems also to remember, that
BobTerm's y-modem batch doesn't work so good with
PC/unix/linux/gnunix/?nix implementations of y-modem batch. Use single
file 1k xmodem with BobTerm I think.

Huh? I thought that, by definition, Xmodem was not a "batching" protocol.
Now, I have seen some ill-informed term programs that refer to Xmodem 1K
as "Ymodem" and Ymodem as "Ymodem batch".

When you say "1k-xmodem batch", you're precisely describing Ymodem--
Xmodem with 1K blocks and batching.

4088. Re: Do DSDD 96tpi disks work with 8bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-11 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <148670@cup.portal.com>
Source record: 87202

Mikael; I have a couple of 96 TPI drives hooked up to my ATR8000. I've never used anything but standard 48 TPI disks in them & they seem to work fine. One of the classic rumors that has been around for years is the only difference between disk media is the testing. Of course this is no longer true for 1.2 & 1.4 meg drives, but during the early to mid 80's the rumor went like this: It cost too much to have more then one type of facility for making disk media & took too much time to do a line change over to a different type of media so...
What companies would do is just try to make the equivalent of 96 TPI media. They would test this to make sure it would pass QC. As soon as they had enough of the high quality media, they continued running the same exact formulation but now only tested it to 48 TPI specifications. And so on down the line until they got to SSSD disks. If any of the batches failed specs, they would then start testing on for the next lower tolerance product. They never threw away anything! The CW at the time was you could use any disks you wanted in any drive you wanted, but you stood the chance of getting a batch that had failed QC vs one that may have been able to pass the higher standards *if* it had been tested at the more rigorous standard. Anyway, if the disks aren't starting to decompose, which would be evident by the surface getting rough spots, the disks are probably the best tested ones you can buy.
As far as I know, the only difference between a 40 track drive & a 80 track drive is the width of the R/W head & the distance it moves/step.

(Somebody wants to null modem A8<->PC. Steve Tucker says BobTerm has
Y-modem batch to do this with.)
Uh..... I think I want to note that people have been getting into
trouble using BobTerm y-modem batch and DSZ y-modem g. It seems that
the transfers work, but not very well. If I'm not mistaken, BobTerm's
y-modem batch is really like 1k-xmodem batch.
Two suggestions. With any null modem (or util) PC<->A8 transfers, it
would be a good idea to use an arced file. This will automatically do
a crc16 on the file, ie. the file won't unarc correctly, or shouldn't,
if the transfer was corrupted. 2nd. Maybe read the excellent FAQ
posted here monthly. It has a fair description of null modeming.

Will, you're right in your assumption you can hook two Ataris together
by the joystick ports. If you just go from Atari to Atari, you don't
need any additional parts, just cross pins 1 & 2 in null modem fashion
from the two Ataris & run one of the MPP handlers. As I recall, if you
run the MPP Express program, you have to also tie the orange line
to ground & force terminal mode to get going. The only limiting
factor is the maximum baud rate is only about 300 baud. I think
you can get 450 from MPP Express, but the only other piece of equipment
besides an Atari to Atari link that used to be able to use it was
CIS according to the docs. I should have mentioned, you have to tie
the grounds together also, they are invariably the black leads.

If you can spare $35, I highly recommend the POOLDISK CD-ROM from Europe. It has several HUNDRED MEGABYTES of Atari 8-bit software already in .XFD format for use with PC Xformer.

I will be making some of the XFD files available on our web page but it will be just a small fraction of what's on the CD. I've had the CD for about 3 weeks and I still haven't even run through each and every file!

By the way, if anyone has a favorite .ATR or .XFD file they use with PC Xformer they'd like to share with others, send it to me and I'll post in on our web page. Freeware and/or shareware files only please.

4093. PC Xformer cables - status

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-12 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <4aih6m$aba@news1.halcyon.com>
Source record: 87115

Just to update everyone, right now I've received about 35 advance orders for the PC Xformer cables. Since that's getting close to "critical mass", I've gone and placed an order for parts to make about 50 of the cables. I expect to receive the parts and start making cables over the holidays later this month, UPS willing, and cables should be ready for sale some time in January. The cost of the cables will be $24.95.

If you're interested in a cable, email me so that I make sure to have enough parts. It's easy to order extra parts now, but once I receive the parts and the cables get made I won't be ordering any more parts for a while. Making cables is not something I care to turn into a full time hobby! :-)

As for the questions I've left unanswered such as "how much will shipping be to Germany?" or "will there be a package price for PC Xformer and the cable?" or "were any animals harmed during the manufacturing of the cable?" etc, I don't know. When I find out shipping costs and bundle pricing, I'll post that information on the web page.

This is interesting, because Activision tennis used the joystick.

Other paddle games

Steeplechase
Kaboom
Blackjack
Warlords
Video Olympics
Canyon Bomber
Circus Atari
Night Driver

Indy 500 used a special paddle controller that spun all the way around.

Actually, as I recall, you get that one from the guy that was chained up in the sewer...
over at the palace, I believe.

I could be wrong though. It's been a while, my floppy drive is dead, and it won't run on PCXformer.

Another trick I liked was to go to a guild where you're an associate member and enter "666" Once you did that, you were pretty much all set.

Well, I grabbed a copy from someone here on the net that seems to work fine (no random failures) with sio2pc... Doesn't run on the Xformer, though.

: advance

I have had no problems building the emulator for Linux but if you
can mail the output produced and tell me the emulator release number
(0.2.1 is currently on ftp.demon.co.uk) I will have a look at it.

Version 0.2.5 will be uploaded in the next few days and will include
sound support via the network audio system - nas-1.2p2.tar.gz which
is available on sunsite. Other features added are vertical fine
scrolling and a replacement for the floating point library. The
replacement floating point avoids performs floating point maths without
going through the 6502 CPU emulation stage. This is the first stage in
implementing a basic OS that provides enough functionality to boot games
without requiring the original OS - anyone got a PD character set they
would like to donate :-)

Bye

: : : 8-bit disks, and I'd really like to transfer them to my PC with as
: : : little fuss and bother as I can muster. I've got the old 850
: : : interface, so hooking my 8-bit into my PC's serial port isn't a
: : : problem.
:
: : Load up a terminal program on your PC like Telix, and trasmit the files
: : from the 8 bit using BobTerm or other terminal program. I believe bobterm
: : has batch Y-Modem, which should make the job easier.
:
: I've had some troubles with BobTerm. A friend who knows the
: old Atai pretty well brought over his copy, and wouldn't ya know, it
: doesn't seem to work on my old Atari 800. We've been talking about my
: borrowing his 130XE or later model, but nothing's come of it.
:
: I'd like to suggest a strategy that perhaps some enterprising
: programmer could follow. It seems that there is a substantial problem
: in getting the PC to interface properly with the Atari disk drives.
: Would it be possible to work up a program for the Atari that would
: allow th PC to use the Atari as a kind of interface to the original
: disk drives?

APE 1.07 allows you to simply use the COPY command of Mydos 4.53 to write
files directly to the PC hard disk using the 'PC MIRROR' feature. Its
quite powerful and does what you describe.

The new version of the Pro System also allows you to make complete ATR
images is exisiting disks with any atari drive.

: Think of it this way. You plug a serial cable between the PC
: and the Atari interface, and load up the software on both systems. The
: software puts the Atari into a kind of "slave" mode, where the PC use
: can send a simple set of commands to the Atari: send file, receive
: file, disk directory, etc. There could be some kind of error checking
: protocol incorporated, and perhaps a rudimentary translation utility
: that would convert Atari's idiosyncratic ASCII into standard ASCII.
:
: Has anyone tried to work up something like this?

Already done :) Get APE @ http://www.nacs.net/~classics

Thanks!
```

: I'm trying to run sio2pc under dosemu with Linux, but it seems that
: dosemu isn't doing a low enough level of emulation on the serial port
: by default. Does anyone have any experience in setting this up?

Yes. Here is how to run APE under linux dosemu. It should work for
Sio2PC as well, should you choose to use that. (but why? ;)

Steve

APE 1.07 works under Linux

From: classics@seka.nacs.net ( )
Date: 1995/11/25

MessageID: 496e77$se8@wariat.wariat.org#1/1

---

organization: APK - Internet Provider for Ohio.
newsgroups: comp.sys.atari.8bit

Many people have asked me to make a native *nix version of Ape. Well, i
doubt that will happen anytime soon but as I type this over my PPP connection
to my Linux box, Im running a disk copy program on another console
in APE.

APE seems to run quite nicely under dosemu 0.60.x with a few small
modifications.

1) In the dosemu-60.x/serial directory, edit the file ser_defs.h and
change the following values:

a) The line #RX_READ_FREQ. Change the value shown to 19L.
b) The line #MS_MIN_FREQ. Change the value shown to 19L.

This will change how often dosemu updates the serial port status
registers for your dos box. We need FAST updates. Change it to
1L if ya feel like it :)

2) In /etc/dosemu.conf, emulate ONLY ONE SERIAL PORT. Comment all the
other ports out. If you enable 2 or more ports things get choppy as it
takes longer to update the serial registers.

3) (Re)compile dosemu and install it, run it, and run APE.

APE should work OK for you. I have /dev/ttyS0 emulated, with
'sillyint' set to off. Setting sillyint to the IRQ of your serial
port might yield some improvment if you still have trouble.

Now the bizzare part. The higher the priority you give 'dos', the
WORSE ape runs. If you set the priority with renice to say '14' then
APE runs so good even APE+ 56kbps ultraspeed works. Amazing.

Well, have fun. Ive been working for about 1 hr now on the linux box, with
APE running the Apple Bandits demo at priority 14, without any disk errors
at all each time it does its reload (about every 15 seconds).

Oops, this is on a 486/DX-100. Cant promise anything on slower machines.

>almost sure here, not like 1k xmodem batch.

Ok, since I have seen quite a bit of confusion on this subject I am going
to attempt at setting it straight...

Xmodem1K - a non batch XmodemCRC-based protocol with 1K block sizes
Ymodem - based on XmodemCRC, but has batch abilities, 1K block size, often
confused as Xmodem1K Batch, there is no such thing, afaik.
(basically the same thing as Xmodem1K, but has batch abilities)
YmodemG - based on Ymodem, but the difference is that it lets the modem
handle the error correction and is apparently a full streaming
protocol (i.e. doesn't wait for the other end to ACK/NAK,
because the modem hardware already handles the error correction
and the data should be there safely).

Ymodem and YmodemG are not the same.

>BobTerm's y-modem batch doesn't work so good with
>PC/unix/linux/gnunix/?nix implementations of y-modem batch. Use single
>file 1k xmodem with BobTerm I think.

This may not be due to protocol implementations, but it could be due to
line conditions, or possibly due to an inadequate datapump.

I have never had a problem transferring files from Bobterm via Ymodem to
my PC via NULL modem cable.

The joystick under linux is handled as a loadable kernel module. It is
stored on sunsite under kernel/patches/console/joystick-0.7.3.tar.gz

While your at it you may want to download and install the Network Audio
System (apps/sound/servers/nas-1.2p2.tar.gz) in preparation for the
next release.

I hate to agree, but I would have to say the same about the tech support thing. I bought 3.2 and asked about the procedure to upgrade to 3.3. I dodn't even get a hello, just a terse message about going to the web page and signing on to the list for upgrades. This wouldn't upset me normally, but I signed up to get 3.2 and it took over 3 months with no explanations and pretty some pretty rude responses from him when I got them at all. I think Derek Mihocka is a great programmer and his accomplishments are many, but I also think for people to accept your work and to build a base of good customers you need to lighten up. After all, we are only trying to support your cause (and ours too) in keeping the Atari machines alive. Sorry if I have offended anyone, I only wanted to speak my opinion.

Source record: 87139

believe it or not, there are still copies of the Action! disk floating around out there. In the last 5 years I've seen two go on sale in the local area alone. Now, while I really shouldn't say this, there is a bootleg version of 3.6 floating around (3.6 was the last cart version) out there that does run. Your best bet though would be to talk to Mike at FTe and see what he may be able to do for you...he did put Mac/65 out for the PCX...

Ryan, I have a cracked/disk based version of Action! but IMO it is not nearly as good as the real thing. For instance, the 8 k banks were converted to a 16k file so you don't have a much free memory. It's less of a problem then it could be since I/O on the emulator seems to be a lot faster, but it still actually takes longer to do the compiles even from ram. I didn't crack it so I don't know what's going on. Anyway, if you want to petition Mike at FTE to give you/me approval for getting a copy to you, I take care of my end.

Hmm... looks like I've been missing some interesting discussions here.
First I see a list of "Atari 800 carts" that includes Tower Toppler, which
as far as I know (well, have ever HEARD, in thirteen-plus years of Atari
mania) NEVER CAME OUT for the 800 (only for the 7800 game system) -- and
now I see Clay Halliwell referring back to a Michael Current article
that I missed COMPLETELY, in which Michael apparently bought some stuff
from B&C that was "never released," prompting Clay to -- once again;
TWICE in about EIGHT messages! -- bring up "Tower Toppler!"

So, let me simply shriek to the heavens: "DID they do Tower Toppler for
the Atari 800? If so, where can I get it? I want it!"

Thank you.

Chris

Dan; Great great game, but I hated that copy protection! I remember having to hold the damm start key down for 2 or 3 minutes before I could get a good read during some portions of the game. I also used to try & time my pushing the start key for 'just as the drive was begining to slow' to get it to do a good read. Worked like this with 1050s, US doublers, Indus, and wouldn't work at all with my ATR8000 because the disks weren't made on something that uses the timing holes.
Anyway, my son was a freshman in HS in '87 I think. One of his friends that had a part time BBS had him phone & sure enough, both AR The City & The Dungeon were up. In hindsight, I wish I would have got the images then since I had nothing but trouble with the purchased disks & they have since gone bad.

The German applications package SAM (including word processor, paint
prog, cardfile and graphical desktop) was published in 1988. After you
have launched a special patch the developers added to their package,
SAM uses the ST mouse instead of the standard pointing device
(joystick) on 130 XE computers (and 800 XL/65 XE, but due to lack of
swap memory SAM runs not so good on these 64 kB machines). The package
was published by RE software, Bretten, Germany, and is spread widely
in Germany because it hadn't any copy protection.

Source record: 87147

Hi all,
I'm trying to run an ATR file from the XF33demo and I always
get 'requires 48k Ram' message and then nothing. Is there a
command line switch that will allow me to switch modes before
I start xf33demo, or is this a feature of the demo version?

I live pretty close to Toad computers so I tink I'll make a
run up there this weekend and see if they have XFormer 3.3

BTW, the ATR is Spelunker. Any help appreciated.

As a matter of fact, DataSoft released a most excellent version of Mr. Do
for the 8-bits. It was really good... included the all the music, little
graphical flourishes, and intermissions from the arcade.

amen

I tooo have had nothing but terse and stupid comments when after
shelling out the bucks the damned 3.3 dosent work anywhere near to
my satisfaction. I have seen freeware for the pc that makes this
programmer look bad.

Having been into ataris since 1980 and owning one of the first
systems available in my area, I have to say this guy is gonna bring
down the house. isnt there a GOOD solid programmer who can take the
atari os and translate it into a good working pc based program?????
AND not be such a buttmunch when asked a realistic question???

I made a long dx phone call 2 days ago for "tech support" hahahaha

I asked if the sounds were supposed to be exact or even close to
the REAL atari sounds (specifically on boulderdash) or if I should
expect a loss of quality. he responds that some of the sounds wont work
hell , where i live it says in the adds that the paid for program WILL
emulate the pokey chip WHICH IT DOSENT ... not in the slightest. I
KNOW what it is supposed to sound like, and it dont, plain and simple.
almost all the sound is gone from the games ive tried. so much for
one set of lies.

I decided ok,,,at least it has some sound ,,,,next question.

my pc joystick that works on every other program for the pc that i own, wont respont to the xformer program. what gives and how do i reconfigure it ????

His only response is "it works" well, folks , IT DONT.

If that is technical support , ...it aint

If you have had similar experience with the false advertising, etc please email me, as I am considering different courses of action, since the company refuses to help the people who are buying the stuff that dosent work.
oh, and btw i only counted 24 pages in my "40 page manual "

Richard, I don't think the standard Atari joystick cable brings out
the 5V line. It was a constant source of annoyance for me since
I had a ton of those along with a 800XL that wouldn't take standard
9 pin connectors from a parts store because of the hoods. For that
matter, my first modem, a Volkmodem 300 baud that I had a cable to
hook up to my joystick port wouldn't fit either w/o first removing
the hood. I think I paid $34.95 for that cable & if you've ever seen
any of my JS to RS232 stuff, you know how I figured it out. Just a
zener & resistor in there so I figured $32 of the price was profit.
Of course you are right if you use a paddle controller vs JS. I
bought several at thrift shops just to get a source of them.

I just downloaded an outstanding Apple IIe emulator for Windows and Windows 95, written by one Michael O'Brien. This is by far the nicest emulator for Windows I've ever seen. I got the Windows 95 version - it's extremely cool! The most common features - the help files, disk image management, sound and joystick setup, and an integrated debug monitor - are available on a small tool palette to the right of the main display area. The whole thing is a complete joy to use....it almost makes me wish I was an Apple II fan. But, I've been a die-hard Atari fan since the beginning, so.....

I'm dreaming of the day when an Atari 8-bit emulator that's this easy and convenient to use will be available for Windows 95. Any screenshots of Xformer 4.0 available yet? Think we could get a cool little tool palette on the side like the Apple IIe emulator has? When will XF4.0 for Win95 be ready?

Ready to send money....

Scott

If your friend has an ST, Mega, TT or Falcon, you should try the
comp.sys.atari.st newsgroup. For the 8-bit computers, all that's
available at present are terminal programs for connecting to a shell
account. There are several of these available with different
options for speed, terminal emulation, and upload/download protocols.

>% [default behavior here]

While I'd love to be able to do this, the problem is that Flick is a real-time application, and the more strings you're looking for simultaneously, the greater chance there is that you'll start dropping characters. There's no chance of *missing* characters, since macro processing takes place in the main loop-- but the macro processing itself will drag the overall speed down.

>I.e, you could wait on any of SEVERAL strings (heck, I'd like to wait on
>MORE than just incoming-serial strings; suppose I wanted to be able to
>"press OPTION to abort" in the middle of a macro?), and jump to the appro-
>priate label BASED ON the event that actually occurred.

Now you're getting into features beyond the scope of Flick. However, Flick will abort a macro sequence if you enter any menu (it drives me nuts that BobTerm doesn't do this).

>(Clay Haliwell (author of Flickerterm 80, or is that Earl.) talks about
>1k xmodem batch being a good description of y-modem batch.)
>I hope someone has been doing some null modem, sio2pc or ape transfers

Argh!! I thought I was being clear but apparently not...

There is no protocol named "1k Xmodem batch". However, as I said,
that would be an apt *description* of Ymodem. Ymodem uses Xmodem
handshaking, 1k blocks, and it batches.

Furthermore, saying "Ymodem Batch" is redundant. There is no such
thing as a non-batch Ymodem. Non-batch "Ymodem" is properly called
Xmodem 1K.

Oh, screw it--

Xmodem 128-byte blocks
Xmodem 1K 1024-byte blocks
Ymodem 1024-byte blocks, batching

(actually, according to the spec, any Ymodem protocol should support
arbitrary mixtures of 128- and 1024-byte blocks)

Blah blah blah. a) please spell my name right. b) I see you find it necessary to hide behind the veil of anonymity. c) no one forces you to talk to me. If you wish to buy one of my products you can do so from any one of dozens of Atari dealers in the U.S., Canada, Germany, England, Sweden, Austria, you name it. Any one of these dealers can answer your questions about the products, and you can order the products through them. If you find it necessary to contact me directly, then all I ask is that you don't waste my time asking bonehead questions, especially for things that are clearly explained on my web page or other product literature. If you want product support, there are clearly defined ways to get that from me. I don't appreciate phone calls at 1am, which is when some people feel it's appropriate to call and ask for product support. For me, 1 am is not. I challenge you to name one other developer or software company that will accept a product support call at 1am or 3am or even 8am on a Sunday morning. Can't name any? So why expect it from me? I also challenge you to name one other software developer or company that will permit someone to call them, claim to own a copy of their product, and demand a free software upgrade right there and then. Bozos call me up every week demanding exactly that. All I ask of people is that they mail in their product registration card so I know they legitimately purchased the product. For many computer users this simple act of putting a 20 cent stamp on a card and mailing it in is too much to ask, yet those same people are willing to spend $10 on long distance phone charges to call me and give me excuses for why they didn't mail in the card.

You might not realize this, but there are a lot of whacked out people out there who unfortunately have interest in my products and I have to deal with them. You apparently are one of them, but as I have no clue who you Mr. Gate Keeper are or why you're bitching and whining, I can't comment on your particular situation.

Look. I am a programmer. I like to write software. I am not a computer dealer. I don't operate a retail outlet. I would MUCH RATHER PREFER that you do business with a real Atari dealer who will gladly take your call and answer your questions, and leave the business of writing software up to me.

If you must call me or send email to me and wish to be spared the pain and suffering of being verbally absued by me, then simply follow these simple steps:

- if you are already a customer, mail in your registration card. Don't ever attempt to contact me for product support until I have your registration card. If I am not convinced that you are a legitimate customer, I can't help you. And given the wide spread piracy of PC Xformer (as with any software only product), it is not sufficient to just tell me you own it. I need proof.

- if you are not yet a customer, first check my web page at http://www.halcyon.com/brasoft/ to see if the information you need is posted on there. If it isn't, then call me and make sure you know in advance what it is you wish to find out.

- if you are calling to place an order, call an Atari dealer instead. They need the business. If you don't support your Atari dealer, he won't stay around much longer, and he'll be less pissed at me for selling to the customer directly.

- if you are calling to report a bug in a product, have details about the bug. Like what you were doing. What program you were running. What kind of PC you have. That kind of stuff. You wouldn't believe the number of bug reports I get that just say "I tried PC Xformer. It didn't work. When are you going to have an upgrade that does?" A bug "report" like that tells me absolutely nothing other than the fact that the customer must be telepathic and expects me to be so too. Last time I checked, I was not telepathic.

- if you are calling to ask what my next product is I'm working on and what features it will have, just go fuck off. I used to be nice and actually tell people what I was working on, but in return I would end up reading posts on the net talking about products I hadn't even announced yet. So unfortunately I am forced to not give out any information other than what I publically post on my web page or print in my magazine ads and newsletters.

- if you are calling to ask how to upgrade from a previous version of the product that you own, stop! Don't even attempt to call me because I will bite your head off. Real customers of mine, who mail in their registration cards, get upgrade notices in the mail. If you do not ever receive upgrade notices or newsletters from me, then you have failed to mail in a registration card. Go back to step 1.

That should cover 99.9% of the situations where I verbally abuse someone. And to answer the next question, yes, PC Xformer 3.3 upgrade notices are being printed as we speak and will be mailed out over the next few weeks.

- Darek

You guys, if we've ever smelled a thread that should be buried, I think this is it. For all his programming talent, Derek is still just a kid relative to most of old timers here. I don't think it is bright to call your customers idiots or for that matter make stereotype comments like all 8 bitters are thieves & pirates, but after I get over the initial flush of emotions I realize it's just a guy right out of college and hasn't quite developed all the other skills he may need for the next 60 years of his life. Actually, if you want to get in a flame war, the comp.sys.atari.st group is the place to visit. Derek seems to provoke an even greater response there with his posts & the ST group as a whole seems to love to bite on flame bait.
As close as I will come to defending Derek is to say I have strong reasons to believe he isn't as savy about the way people access the net as he probably is with his own hookup. For instance, I imagine some people may have a web browser that doesn't allow transfers because they are teleneting or even using something like email to access the web. The whole http://www thing is completely useless to these people as a means of getting upgrades. *IF* you do have a decent web browser, I did bother to verify that everything that Derek said is there can be found. That I found it at all is amazing, I'm trying to remember how long I've been on the net, seems like 5 or 6 years, & I still plead ignorance to most functions beyond reading & posting to this newsgroup.

Is Mr. Do's Castle the one where you run around hitting stuff over the head with a hammer? When SJC was winding down operations they had a couple of boxes of "used" disks @ $1/each. I bought a couple of dozen of these & I think Mr Do was on one of them. BTW: This is also how I picked up my file version of Action! There were several other little gems, like a version of AMIS already set up to run from a 48k Atari with a single 810.

Actually, with the 74HC series chip, it works fine without the mod. The CMOS
doesn't draw the current and works just fine. I had a wiring problem on my
end not reading that some of the pins needed to be tied together. It works
great. I also received a 1489 version from Rick Cortese who helped me to get
this thing going right.

Message-ID: <4aoeqe$366@kiwi.ind.tansu.com.au>
Source record: 87082

I downloaded Atari800-0.2.1.tar from ftp.demon.co.uk,
and I got the rom images from xf25. I built the x11
version, and ran it as "atari800 -rom ataribas.rom".
However, I'm left with a brown screen with beige
borders. Any ideas what could be wrong? I built
it with the library path correctly (it works well
when built as the "basic" or "sunos-curses" version).

The x11 version will refuse to work for me.. any
ideas? I run SunOS 4.1.3.

Many thanks!

It's been a while since I've done much with xformer (I prefer Unix
over MS-DOS), but I believe you have to give it a switch (maybe -j) to
make the joystick work.

Holding down start key? It's been a long time, but I think you only had to hold down a special key
briefly on power up to bank out Basic on XL/XE's. I know I wrote special code to bank out the OS
and use the full 64 or 128K on XL's and XE's (I think there was only one other program at the time,
a word processor, that used 128K), but I thought the I banked out the Basic as well. I also recall
1050's reacted differently from 810 drives and returned a different error code, and needed a delay
to reset when they encountered wanky sectors. I recall the first shipment, only a couple hundred
units, that had a problem with protection, if you had a only 1 drive, and it was a 1050, the game
didn't run. Hope you didn't get one of those. Also, there were drives like Trak, that read an
entire track at a time, and didn't reread a sector, therefore the sector would appear the same for
all 3 reads. You had to disable track buffering on those drives, or make sure you didn't use it for
disk 1.

Cracked in '87? Cool, and a tip of the Hatlo hat to whoever did it. I'd like to know how they were
able to do it. We had special boards in our 800's to bank out the OS and put my mini custom
OS/debugger/slave code into the machine and flip back from Atari OS to ours. When the game loaded
it used all memory in the machine, including page 2 where the OS stored it's interrupt vectors.

I'd still like to know if an image of these games is around, and if it works on the XFormer. I'd
love to see it after all these years. I see games now and say, We did that back in 1980 something
(what year did it come out?)

4163. Boulder Dash on XFormer 3.X

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-14 00:00:00 UTC
From: ime@zombie.hancad.co.at
Message-ID: <4aokjj$ovj@hancad.hancad.co.at>
Source record: 87085

How does run Boulder Dash on PC XFormer 3.X?
It works quite well on XFormer 2.5 but without sound and joystick
support it's quite annoying.
Also the nice graphics (i.e. the rainbow effect in the diamonds) doesn't
work very well.

Adolf

4164. Copy Party in Poland. Soon.

Newsgroup: comp.sys.atari.8bit

Just because you sell a product to a hobbyist doesn't mean you don't have to be professional about your business, it hurts the Atari users as a whole because its hard to recommend a product that has poor customer relations

>How about keeping your beef with Darek between the two of you, and
>not carrying it over to all of CSA8.
>
Hum if you read the first sentence in the above capture you will see it in the form of a question.

>Have you DONE ANY business with Darek? The last sentence seems to
>indicate you have YET to even purchase anything from Darek, hence
>you would be unfit to complain.

Thats really makes no difference. If I have I wouldn't again and if I haven't I won't.

>Who are you anyway? How dare a "newbie" come into this conference and
>start slandering (which is exactly what you're doing) an Atari supporter
>without any "apparent" first-hand knowledge.

This does not matter either I am a person with a point of view and am free to state personal experiences. I have owned Atari's since the 400. And think they are a wonderful machine and Darek makes fine products he just needs to add some tact to his tech support.

4168. Darek Mihocka and the flaming assholes

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-14 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Dec14.103208.19335@wariat.UUCP>
Source record: 87090

(Talk about D. Mihocka and PC Xformer 3.x and support, etc.)
This thread is going to piss off Mr. Mihocka. Ben Poehland
took some of these critical posts and we don't see him much
any more. I suspect the same will happen with Mr. Mihocka.
One poster asked if somebody couldn't write a really
'decent' A8 emulator for the PC. This person shows a real
naievity about where A8 is. A8 is dead and the attitudes
expressed by some 'consumers' isn't going to help bring any
further new things to it.
I haven't seen PCXformer. I don't have the hardware to
run it. I would be interested in the product if I had the
hardware. So, my point. Why don't some of these people
with a low opinion of PCXformer write an article, just a few
paragraphs, describing how the program works, compare it to
other similar products (there are a few if you look) and be
somewhat objective instead of the put-down that it doesn't
work to their expectations and flame Mr. Mihocka's abilities
and integrity.
As for the asshole 'Gate Keeper', I've always hated
anonymous assholes like this. I give a shit about his
opinion, which, like the asshole he is, everyone has one and
everyone thinks everyone elses' stinks.
So, do us all a service and tell us something about the
product, good, bad or indifferent, but objective. Like,
does the person who thinks 'Boulderdash' sound stinks have a
sound card or is he expecting great sound to come out of his
PC speaker?

I think Darek is an excellent programmer, but has to learn to be more customer oriented. People who purchase his software should be his primary concern. You have to be nice to them. I've been in tech support long enough to know this.

Anyway, if you do mail darek at brasoft@halcyon.com [with his requirements], and are a valid Xf3.x user, you can get your upgrade.

Please note: When you sign in for the download of Xformer 3.3, the NAME and PASSWORD are CASE-SENSITIVE. I wish I knew that before giving up a few times before. I had to use all caps to successfully sign in.

Well, I hope he continues to produce newer and better versions.

good luck DAREK!

Holding down start key? It's been a long time, but I think you only had to hold down a special key
briefly on power up to bank out Basic on XL/XE's. I know I wrote special code to bank out the OS
and use the full 64 or 128K on XL's and XE's (I think there was only one other program at the time,
a word processor, that used 128K), but I thought the I banked out the Basic as well. I also recall
1050's reacted differently from 810 drives and returned a different error code, and needed a delay
to reset when they encountered wanky sectors. I recall the first shipment, only a couple hundred
units, that had a problem with protection, if you had a only 1 drive, and it was a 1050, the game
didn't run. Hope you didn't get one of those. Also, there were drives like Trak, that read an
entire track at a time, and didn't reread a sector, therefore the sector would appear the same for
all 3 reads. You had to disable track buffering on those drives, or make sure you didn't use it for
disk 1.

Cracked in '87? Cool, and a tip of the Hatlo hat to whoever did it. I'd like to know how they were
able to do it. We had special boards in our 800's to bank out the OS and put my mini custom
OS/debugger/slave code into the machine and flip back from Atari OS to ours. When the game loaded
it used all memory in the machine, including page 2 where the OS stored it's interrupt vectors.

I'd still like to know if an image of these games is around, and if it works on the XFormer. I'd
love to see it after all these years. I see games now and say, We did that back in 1980 something
(what year did it come out?)

[snip]

Well, I haven't really worked with XFormer all that much. I've got an Atari 800 setup in my basement that has my old 386sx slaved to it (Intel outside, indeed!) via SIO2PC for the hard drive, and that's where I do all my Atari stuff (OK, mostly games). As a matter of fact, I've got about 6 Atari 8-bits of various shapes and sizes laying about the house, with a lot of accessories, but I use the 800 with the 386sx slave exclusively.

I admire emulators more for the fact that, as a developer, I think that they're incredibly cool hacks, rather than for their usefulness. The emulators that have impressed me the most have been the C64s Commodore 64 emulator, which seems to run just about everything, and Jeff Vavasour's TRS-80 Model I emulator, which DOES run everything. The aforementioned AppleWin emulator seems to be pretty robust, as well.

I think the Atari emulator is probably MUCH more complex to pull off than either of those two, though. As I said, I haven't used the emulator too much, since I like to use the actual Atari, but I brought my SIO2PC disk images upstairs and used them with the demo version XFormer 3.3 running on my Pentium 60. Generally, I've had about a 50-60% success rate running stuff (mostly games, which are the hardest tests, I think) with it. Some things run but have problems (Pharoah's Curse has some sort of corruption with some of the PM graphics; Satan's Hollow freezes after the first wave; Fort Apocalypse loads but the collision detect is hosed). In some cases the game runs great, but the bottom couple of lines of the screen are cut off. Some of these may have to do with it being a demo version, some of it might have to do with my particular hardware setup; I don't know. I will probably buy the Win95 version, since some of those hardware compatibility issues will cease to be issues.

I'll also point out that I think Derek's performed a valuable serice to the 8-bit community and, while he's not exactly going to win any J.D. Power & Associates awards for customer relations, he certainly made some good points in his post. And I think he should *certainly* get some positive recognition for being able to pull off any kind of emulator at *all* for a complex little beast like the Atari 8-bit....

My $0.02.

Scott

4181. Re: Why I won't do business with Darek Michoca

Newsgroup: comp.sys.atari.8bit

From: kendrick@zippy.sonoma.edu
Message-ID: <4asqdt$1tb@nuke.csu.net>
Source record: 87009

Ok, so now it's a Rainbow vs. PC Xformer flame war.

Jeez us christmas, people!!

CALM THE HELL DOWN! Yes, we've all seen Darek rant. Yes, we've all seen
Gate Keeper (not Ivo (btw - any new software developments? ;))) rant
(at first, almost intelligently, but now very childishly).

But as for saying "PC Xformer is better than Rainbow" it's like saying
"Ball Blazer for C=64 is better than Ball Blazer for Atari XL".

They are for two completely different platforms.
They are by two completely different authors.

All I know is, from what I've seen, they both WORK REASONABLY WELL, and I like
BOTH of them. Just because I'm a Mac user, and have seen newer versions of
Rainbow running on fast machines (and have seen only Xformer 3.0 on a 386),
I'm not gonna say "RAINBOW IS >>WAY<< BETTER THAN XFORMER!"

Now, perhaps if some 3rd party (perhaps... Atari Classics? :)) sat down and
UNBIASEDLY compared PC Xf and Rainbow (and Atari800 for Unix, and a real Atari)
running MANY different programs, from simple speed tests to full out kick-ass
games like MegaBlast and Alternate Reality, to useful applications (DDIII,
TextPro, disk utilities, etc.), >>THEN<< and >>ONLY THEN<< can people claim
that one program is better than another.

Me, I'll stick to Rainbow. Why? Because my PC is an 8086. My brother's
computer is a PowerMac 7100. My school uses Mac Centrises and PowerMacs.
That's why.

As for which AUTHOR I like best - neither. I've had both good and bad dealings
with Darek. I've had good (but few) dealings with Chris.

But, even if I did like one over the other, I wouldn't go around PREACHING
it, especially not here.

Go to .advocacy or something, jeez!

Get the 1050. Yes, the Indus GT is a very good drive and I have 3
that I won't let go of, BUT, it won't support High Speed mode without DOSXL
with sycoromesh or SDX. No, High Speed mode is not built into all DD Drives.
Some can, some can't. PERCOM is one that Can't.
As a note, a 810 drive with a Archiver or Happy will support High
Speed mode, but Won't do Double Density.

>Many thanks!

I just worked out my problem: my X server had run out
of colours. It now works like a charm. Kudos
to D Firth!

There are still some problems with the emulator, I
noticed that the demos that come with xf25 don't
run very well (the graphics tend to get corrupted).
For a beta 0.2.1 version, however, it's still great.
Well worth looking at.

Looking for a double density 1050 or equivalent disk drive, such as an Indus.
If you have one available for sale or have any suggestions where to buy one
for a good price, please send mail.

Also, given the choice of an upgraded double density Atari 1050 drive or an
Indus brand, which is better? Is US speed doubler/sector skew built into all
double density drives?

Thank you.

Speaking of bugs, I figured I'd finally gvie Xformer a try, so I grabbed the latest demo version off his web page.

Imagine my surprise when one of the included demos ("SWANDEMO") failed to work properly! Everything looked fine, except for the spinning Fuji logo, which was severely hashed. The correct data was getting up there (I could make out the rainbow colors of the front), but apparently it wasn't being formatted correctly. The swan flew in front of this mess just fine.

This has to be some sort of problem with the emulator, doesn't it? If it were a hardware problem it shouldn't be running at all.

Hell, I will be happy if my version 3.3 would perform 1/3 what the
advertising promised. I have rerouted joystick ports, tweaked the
sound card, etc etc made several long dx phone calls only to be insulted
by certain programmers, and it has almost totally turned me into
an "any damn thing but atari" fan after loving that little machine
for over 15 years.... thank god for vga, stereo sound, and cdroms.
If my "amazing " xformer dont work soon, I am gonna get my money back
on the basis that the 40 page manual is only 24pages....i get this way
when I feel Ive been ripped off .

I would settle for ANY sound, and ANY joystick support for 3.3
it sucks, sucks sucks and I dont respect anyone who CLAIMS to
be a programmer and cant make a damn joystick work and be rude to me
on the phone after I paid for the call. the only nice thing i get is
when the money is sent. Is this why piracy reigned supreme in the
"REAL" atari era????? I remember another arrogant bastard at electronic
arts who spent more time putting copy protection on disks than content
but there wasnt one that didnt get bbs'd months before it hit the
stands. (I remember paying 50 bucks for pinball construction set
and after 2weeks the disk died from copy protection.... I never did
pay for another ea product ......

If anyone is comtemplating buying xformer, you are being ripped off.
there is no tech support, no joystick , the sound is AWFUL and nothing
like a pokey chip on the real atari (xformer sounds like my
daughters jack in the box, one voice , no range, no rich atari sounds

and to top it off, THERE AINT NO 40 PAGE MANUAL AS ADVERTISED,,,

If you are reading this,,,,darek,,,,, It aint gonna stop till I get
a working program or I get my money back in full....
You had your chance when I made 3 long distance phone calls to you
and all you had to say was " it has to work" well , it dont!!!!
and since every other program i have that uses a joystick does work,.
I have decided that you dont know jack about the insides of a pc.
(this guy actully likes windows 95) No atarian in their right
mind would make that statement....Instead of wasting time trying to
jump on bill gates bandwagon, get down to emulating the spirit , sound
and ease of use of the atari 8bit, or stop trying to make money by
lying about a half finished product...

Well - knowing the model is pretty important, because if it's an Atari ST, it's completely incompatible with the Atari XL/XE's we discuss here in comp.sys.atari.8bit. If you could describe how the computer looks, and the interface he uses (ie, point and click and it looks very similar to a Mac, or is there even a mouse attached to the thing).

Anyway, if it is indeed an Atari XL/XE (no mouse (although you CAN hook one up)), then go for:

FlickerTerm 80 _or_ Ice-T These are high quality 80-column terminal programs supporting "VT" escape sequences.
If your friend has a "shell" account on a "Unix box" or some other machine like that, the 80 columns and VT support will help enormously.

BobTerm A high quality 40-column terminal which supports a number of download protocols.
and/or

AtarZModem Stand-alone Z-modem download protocol program. (Temporarily quit the terminal and load this up to download, then reload the terminal).

This will give him access to:

Usenet news (with a newsreader like "trn", "tin", "rn", "pine", etc.)
World Wide Web (with a text-based Web browser like "lynx")
E-mail (with mail programs like "mail", "elm", "oak", "pine", etc.)

I could go on (FTP, Gopher, etc.) except all of this is quite easily accessed via the Web, so all I need to mention is "lynx" :) (and heck, I could stick Usenet news right into the "Web" too...)

As for graphical Web browsing on the Atari 8-bit, it's long off (not impossible, but probably not too practical either :)).

If you have an ST, I'm not sure what there is out there, but at least as much as I mentioned (80 column VT/ANSI terminals and file download protocol support). From what I've heard (a while ago) there is no Web browser for the ST either (but again, just use Lynx). For the AMIGA, on the other hand.. :)

Good luck!

:
: Holding down start key? It's been a long time, but I think you only had to hold down a
special key
: briefly on power up to bank out Basic on XL/XE's.

Actually thats the option key. A problem with some 'semi-cracked' versions
of Alternate Reality was that the missing phantom sectors would cause
the intro-demo to fail, and holding start after the 'Datasoft' screen
appeared would immediatly skip the demo and start the game menu.

: Cracked in '87? Cool, and a tip of the Hatlo hat to whoever did it. I'd like to know how
they were
: able to do it.

I once cracked AR, but I much prefer my fully-protected image running
under APE since the demo is still intact :)

> We had special boards in our 800's to bank out the OS and put my mini custom
: OS/debugger/slave code into the machine and flip back from Atari OS to ours. When the
game loaded
: it used all memory in the machine, including page 2 where the OS stored it's interrupt
vectors.
:
: I'd still like to know if an image of these games is around, and if it works on the
XFormer. I'd
: love to see it after all these years. I see games now and say, We did that back in 1980
something
: (what year did it come out?)

82 mabey? Is has to be written on my AR package somewhere, but where the
AR package is... well.. who knows anymore.

I doubt Xformer can run AR. Its probably the most graphically demanding game ever writeen for the 8 bit. If the Xformer could run AR, i bet it could run ANYTHING.

Hi again.

After downloading Xformer 3.3, I noticed my joystick doesn't work; more than a minor glitch. So, I ran xformer 3.2 to see if it was me. Nope. Joystick worked.

Does anybody else have this problem???

I have no joystick problems with any other software or previous xformer versions. I hope that that will be changed rather quickly. I'm sure a lot of people will be downloading the newest version *3.3* from Darek's www-page.

How could such a bug slip out not noticed?

-Z

4200. Re: 800xl wanted (me too! I got my MUX!)

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-15 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <4aspg3$1tb@nuke.csu.net>
Source record: 87028

I too am looking to buy an 800XL. I just got my MUX! The thing is, since I only have two working 8bits at home, it's COMPLETELY USELESS! :) Since I only have one slave, it's just as if it has all of the hardware that the host has connected to it. (It's like, "why not just hook it up DIRECTLY to that hardware!?" :))

So, I'm looking for a 64K (or, even better! 256K (or more?)) 800XL to hook up.

Now, for people interested in the MUX (I never got enough info about it myself until I got it!), it is:

1 host cartridge (no cart. port on top, terminating resister pack inside, and the slave ID jumpers are soldered)
2 slave cartidges (cart. port on top, terminating resister pack in one of them (it's a socketed chip thingy), and slave ID jumpers are connected to dip switches)
2 MUX 1.1 ROMs (fortunately, my main system, which is my slave, had a socketed OS chip, so it was just "pop the top, switch the chips" - also, fortunately, the one machine here that DOESN'T have a socketed OS chip was the one I wanted to be the host (no Sweet16, no 256K RAM))

The cart. cases are a bit ... flimsey. It's taking a bit of getting used to to put carts on top of the MUX slave carts, too, but it could just be a "breaking-in" period. Also, the cases are held together by rubber-bands. I sorta wish they were more "snap-shut" cases, but oh well.

The OS provides the "M:" handler (for slave-to-slave communication), the ability to access SIO devices through the 34-pin connectors that hook the slaves to each other and to the host, and a setup screen (in place of the Self-Test) and even a mini monitor! (Yeah yeah, so I'm not used to this!) Oh, and it slightly alters the screen colors (that kinda annoys me - that shouldn't be tampered with, IMO - or at least it should be set up by the user (along with slave defaults)) and adds key-click-off (doesn't work!?), screen-DMA-toggle (like 1200XL), and I/O noise toggle.

The M: device is a cinche to program for. It took a little figuring out, but I got the BASIC program example (a simple chat program) converted into Action!. (Action!'s lack of "Status" call is annoying) (Also, how does BASIC do it? In Action!, I need to call XIO and then pull the Accum. off the CPU (via a dummy PROCedure) ; and when I call the XIO, I must specify the device. In BASIC, you just specify the IOCB number...)

The setup is nice, too - you can assign D: accesses on each slave to correspond to any disk ID on the host or the slave! (My setup has both D1:

and D2: on the slave accessing D2: on the host (so I don't boot up into the host program on the slave!) and D8: on the slave being D1: on the host (so I can still snoop around in it). Also, printer can be altered. Oh, AND you can alter any OTHER slave's setup! :)

Some problems I've had, though:

(1) SIO2PC won't let the host talk to drive 2 (at least when the slave asks)

(2) APE won't let the host write to any drive (could be because it's somehow getting into Happy speed and I'm running an unregistered ver. of APE because I haven't bothered to get upgraded yet :))
But, if I disconnect the host from SIO2PC and hook the slave up to it (of course setting the D: configs. properly), I can get the slave to write to APE fine! (Again, I think the host has gotten itself into Happy mode - I guess Bob figured "If you have it, use it". Thing is, being an unregistered-APE-1.07 user, I don't ACTUALLY have it to use!)

Anyway - again, it's a well made peice of machinery (except the cases <:^/) and was VERY easy to setup (and, from the docs, sounds like it could take an electronic beating pretty well - "This error could be because the cable is in backwards").

So, if you've got a number of 8-bits and want them to share stuff and/or talk to each other (or play MUX-games once I make some! muhahahah!), AND have about $150 to spare, get a MUX!!!

: This thread is going to piss off Mr. Mihocka. Ben Poehland
: took some of these critical posts and we don't see him much
: any more. I suspect the same will happen with Mr. Mihocka.

I surely hope that the internet Atari 8bit community doesn't lose the input of one of it's greatest contributors. I imagine he can endure a critical comment or two, though.

: One poster asked if somebody couldn't write a really
: 'decent' A8 emulator for the PC. This person shows a real
: naievity about where A8 is. A8 is dead and the attitudes
: expressed by some 'consumers' isn't going to help bring any
: further new things to it.

"Dead?!" Bite your tongue! The fact that we're having this discussion proves it is not dead. It's more novelty and nostalgia than functionality for a lot of us though.

: I haven't seen PCXformer. I don't have the hardware to
: run it. I would be interested in the product if I had the
: hardware. So, my point. Why don't some of these people
: with a low opinion of PCXformer write an article, just a few
: paragraphs, describing how the program works, compare it to

I didn't bitch but briefly for your information it is a functional and reasonably reliable emulator that has had a hit rate of about 85% for the programs I've tried. It runs cartridge images almost without exception. Pitfall II didn't fly. AR doesn't fly from what I hear. Rescue from Fractalus does though and that was one of the more demanding Atari games.

: As for the asshole 'Gate Keeper', I've always hated
: anonymous assholes like this. I give a shit about his
: opinion, which, like the asshole he is, everyone has one and
: everyone thinks everyone elses' stinks.

It would serve this group better if you avoided the profanity and crude metaphors like 'Gate Keeper' did. I could have sworn his address was identifiable somewhere in the header though.

: So, do us all a service and tell us something about the
: product, good, bad or indifferent, but objective. Like,
: does the person who thinks 'Boulderdash' sound stinks have a
: sound card or is he expecting great sound to come out of his
: PC speaker?

Umm, I don't have a sound card but I did try running my copy on a
borrowed '486 and the sound seemed... functional but half-baked, not
like I remember my Atari and perhaps missing a voice.

Body handling: HTML body converted to readable text

Dan; Actually, banking out basic as I recall was automatic. The AR series was on of the first and few games to do this. Thinking about it, I can only remember HomePak I think that was smart enough to do this at that time. What I was talking about is the "Insert disk 2 side 1" messages! Just about everybody I know that was playing the game complained about it with, "I insert the disk, but the program refuses to ack it's the right one" For some reason the program would routinely have problems like this. Still, great game & the game play made up for it.
You could break into the game with Omnimon also. It was funny because when Phil Price came by he mentioned he looked at the OPTION/SELECT keys to make sure someone wasn't about to break in & cleared memory if they were. The solution to this was to just hold down reset THEN depress the keys. I still look back fondly on some of the stuff you guys put in that thing, The Loadstone, The Devourer, I think the wizard or thief was named Ozob i.e. Bozo spelled backwards. For the next 6 years or so, whenever I played a CPRG I always created a wizard named Son of Bozo!
The AR games weren't the first I bought, I think that honor would go to Ultima III. But after playing UIII for several evenings I gave it up wondering why anybody would want to play this type of game. After The City & The Dungeon I went back & found I could enjoy Ultima III & have been playing this type of game ever since. It lead to a real change in my buying habits. Up until that time I think I totaled up my software purchases & I have spent approximately $1500 on sofware, about 80% games, 20% applications. The AR series really represented such a value, $40 and the games would keep you occupied for months! In the 8 years since then I don't think I've spent $1500 on software, mostly just because I buy CPRGs that take months to play vs a shooter that you get bored with the first weekend. So... needless to say I'm greatful you guys did such a fine job on AR. In the long run, it probably saved me a small fortune in software purchases.

Don't forget the Atari XF551. It's double density and double sided. It has a high speed mode, not quite the same as the US Doubler, but Spartados 3.2 can be patched to work with the XF high speed. And you can probably still get the 3.5-inch 720K drive upgrade from Bob Puff.

4210. [--- BOBTERM YMODEM padding ---] (was: Transfer 8-bit to PC - how?)

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-16 00:00:00 UTC
From: winston@merk.com
Message-ID: <DJoBqu.A67@merk.com>
Source record: 87032

This discussion about UNIX YMODEM and ATARI BOBTERM YMODEM has come up before. Bill Marcum has pointed out that the UNIX YMODEM batch header information doesn't appear to correspond to ATARI YMODEM header information because of the different directory structures. Barry Gordon has pointed out that UNIX YMODEM and ATARI BOBTERM YMODEM "pad" files differently based on record length, and therefore have a problem synchronizing the End-Of-File. The relevant text now follows:

The Pinball Construction Set supports the paddles as an input device. With the paddles plugged in, each paddle fire button supports the flipper on that side of the table, giving you more of a pinball type of feel to the game play (a much more natural feel than that of using a joystick).

Speaking of which, I just got my first HES cartridge! Happy happy joy joy ...
but it's an 800 cartridge, not a 2600 cartridge. The label is yellow, and
says:

Gridrunner

by Jeff Minter

>HES [ ][ ] Gridrunner

And of course, it sucks. :) NOT! Actually it's based on Centipede but
has a *lot* of new elements added. The control is also different; the
grid is much better adapted to a joystick (or Atari Trak-ball in J mode)
than the ports of arcade games like Centipede and Millipede, which use a
Trak-ball in the arcade, and whose 8-bit home ports usually lack that
certain something in terms of control---control often needed when Centi-
pede is at its height of chaos and every shot must be a well-placed one.

There is one thing I don't understand: there's no llamas in it.

Still a good, good game. I like it.

Source record: 87036

I am in desperate need of a descent joystick!!! Man! Are they hard to find now!

Of course I am a very picky joystick buyer. I do NOT want a flight stick. I must be switchable from 4 position to 8 position (this is definitely a must). It should have a metal shaft. Last but not least, it should have at least a button on BOTH sides (I'm left handed, my wife is not!).

I know they exist, I used to have a couple of different ones. Kraft made one but it had a plastic shaft. This would do, as the one I have now has NONE of the things I just listed. Someone else made an ideal one but I can't remember who they were. It was blue and had a black piece on top that you used to select 4 or 8 position. It had a metal shaft and the buttons were on the front, not the top, if you know what I mean.

Anyway, if anyone knows where I can get such a stick, or has one they can part with, PLEASE let me know!

Thanks!

I believe PRO is the format used to store copy-protected disks for use
with APE. AFAIK, it has nothing to do with BBS Express Pro.

Now, as far as Atari800 supporting them: I'd rather have it support
individual files as disks the way xformer does.

Greetings all. I finally got out of alt.*.*.* and down to comp in the news groups. Just wanted to briefly introduce myself:

Keith Hyer
Atari 400, 800, 800XL, 1200XL user. Never got a 1450XL but the pictures in ANTIC magazine looked cool!

I'm now a convert - IBM'in for about 4.5 years - Just got Xformer 3.3 and think it's cool! Way to go Darek!

I'm taking the .asm and .c files that come with the package in UTIL\ and working on a program (which I'll release to PD if I can get it working) to read Atari 5.25 disks (hopefully in multiple densities) in IBM drive and write images (.atr / .xfd). But I'm going to need assistance with the file formats for those. Hopefully someone in here will know - and be willing to share - what the formats are.

I read through all the messages in here before posting this. I have only two things to say:

(1) I'm a database programmer - trust me - don't ask the programmer of a system what's wrong. Ask the tech - the guy who gets paid to translate techno-babble into english. In other words - give Mr. Mihocka a break. He probably wouldn't program at all if he was a fantastic public relations guy - he'd do PR instead..

(2) This goes back to early posts I saw: I have AR:C & AR:D. Both are shall we say, "grey" market. I had the same disk problems with the originals. I haven't tried them with xformer yet. I'll let you know if they work.

Ok, ok so my introduction wasn't so brief..
Be seein' ya'

-Keith

joy ...
>but it's an 800 cartridge, not a 2600 cartridge. The label is yellow,
and
>says:
>Gridrunner

>There is one thing I don't understand: there's no llamas in it.

hehe... that version is a bit chunky on the graphics, as I had never coded the 800 prior to doing that, and I just hacked it over from the c64 code in a couple of days without really using the nicer graphics modes on the Atari.. still, it was at least playable.

Incidentally, HES did a conversion of the sequel to Gridrunner, which was called Attack of the Mutant Camels [MATRIX in the UK]. This was completed on the 800, and graphically a *lot* better, but sadly never released - somebody may have a rom image on disk somewhere (hell, I do, but buggered if I know where it is now). That *did* have camels in. There was also the UK version of Attack of the Mutant Camels on the '800, released by Llamasoft, which was a completely different game (picture Empire Strikes Back with nice DLI skies and giant camels instead of Walkers)...

D2K on the Jag is the first of my games to star an actual digitised image of a real beastie - in the hidden Flossie Mode you can actually fly my beloved Flossie the Prettiest Sheep in the World, rescue llamas, and shatter your enemies with Flossie's awesome Bleat of Doom :-)

>Indy 500 used a special paddle controller that spun all the way around.

Ah yes, the driving controller.... but wasn't that more like a mouse
or trackball? A paddle controller has a variable resistor, so "all the
way to the left" is the minimum resistance, and "all the way to the
right" is the maximum resistance; there's no way to make that wrap
around without some major discontinuity.

In mice, trackballs, and (I'm assuming) the driving controllers, a
digital signal is sent, and the software has to interpret direction
and speed from that. Unlike the paddes, it allows unlimited motion.

Atari Connection had a good article on reading trackballs around '83.

<snip>

Well, Russ, the problem here is that PC Xformer isn't what
is being flamed, it's Darek's attitude. I agree that
customers can be idiots sometimes, but you need to be able
to deal with that when you're selling a product.

PC Xformer is a great product, and Darek has done a wonderful
job so far - better than anyone else has managed. I've been
loyal to his efforts since he started working on an 8bit
emulator for the Atari ST. I've always thought his attitude
was a bit harsh - even to me, someone supportive who has
at worst made reasonable suggestions on future improvements.
Luckily, I have a pretty thick skin and am well aware of the
"I am programmer, I am god" attitude people get (I've been
there myself before...)

I can't blame "Gate Keeper" for his posting. He bought
Darek's product and has gotten attitude from him regarding
upgrades and support. Maybe he deserved it. Having an
annonymous or misconfigured mailer certainly isn't helping
his case. Darek says that people call him at all hours of the
morning. My reply is: What do you expect? You set yourself
up as a business, "BRASOFT", and people will call you at any
time - assuming to get an answering machine if not a human
being. If I didn't know any better, I would certainly not
hesitate to call whenever it was reasonable to me.

At any rate, my point here is not to continue the flaming, but
to try and give a little backbone to "Gate Keeper"'s post.
It seems like everyone jumped on the "Gate Keeper"-is-a-flaming-
asshole bandwagon, which I find very disturbing since he
didn't say anything (IMHO) to deserve it. Sure, we should
support the few people who are still making products for the 8bit,
no doubt about it. But does that mean we should hold back

anything but positive comments about those people? Not if
they're reasonable and deserved critisisms.

I expected "Gate Keeper"'s response to be returned by a bunch
of I've-Dealt-With-Darek-And-He's-A-Great-Guy posts, but that
didn't happen. The strongest replies came from people who don't
even own PC Xformer. I think that's very telling.

Personally, I've yet to get my registration code for 3.3. The
first time I tried from Darek's web page, I got flamed for
making a suggestion on the cables he's building. I apologized
for making the suggestion. I never heard back about the apology
or about my registration code. I later realized that I hadn't
placed a userid and password on my first message to Darek, so
I tried the web page again, this time adding those items (and
making no further suggestions). Haven't heard back yet.
Yes, I sent my registration card in back when I bought version
3.0, and no, I've never called Darek at all - never mind after
midnight PST.

One other person in this group has been posting that he got 3.3
from the web site. Assuming this is the registered and not
demo version, then I can only guess that Darek is very busy and
not actually ignoring me. That's fine - I can understand getting
so busy you don't have time for replies right away...

Well, I didn't mean to rant for this long. To sum things up,
I hope Darek continues to support the 8bit community for a long
time to come. He's obviously a great programmer, and we need as
many like him as possible in our midst. I know that dealing with
customers is a pain in the butt (I was manager of technical support
at our company for some time - imagine dealing with nothing but
customer problems all day long), and if he dislikes it as much as he
seems to, then I hope he can find someone else to do that part of the
business for him (this is very common practice - keep the brains
away from the clients). On the other hand, I think "Gate Keeper"
(for God's sake, fix your mailer or post with a real name) lodged
a legitimate complaint and am surprised at how he was simply
flamed for it.

Good luck to all of you...

Yes, the naive person has a 16bit stereo soundblaster card, a 486 /66 and all the
goodies . same person has a 1meg atari800 built by self, a rack of old broken down
atari hardware (NOT FOR SALE)....and spent over 15 years playing with, running a
business, and generally loving the 8bit. (never did buy an amiga, or an st to many
politics went into those machines)
Was president of the southern illinois atari user group 1981 - 1983 (r. i. p.)
sysop'd the "doctor is in / inner circle bbs (atari based) 1982-1983
I have some strong convictions about atari and i also have some strong convictions
about software being sold before it is done. (the only peice i ever released was
the INC Lottery picker for atari and that was PD due to the fact I realized that I would
be ripping people off selling something that had good statistical engine, but
only occasionally would hit more than 3 matches.
When I write, it is the truth and sometimes the truth hurts especially a sensitive
programmer, but when same has forgotten that unlike a car, his name is forever
on that peice of software, and technical support is part of software release.
I think it is time to let him know that.
ps...email me and I will be happy to give you my "real name"
I assure you that mr.mihocka has my real name (it is on the registration card, and
we finally have spoken in real terms about what might improve the xformer program.

(Talk about my flaming post about flaming D. Mihocka and 'Gate Keeper'
post.)
Bill K. sees GK's post as a response to other people's not getting
response or being able to register on BRASOFT's web page and download
and stuff. I saw 'Gate Keeper's post as a sanctimonious effort to
announce that he isn't going to buy 'PCXformer'. I didn't get any
reason, but guessed that he tried to get something for nothing and got
po'ed. What I particularly disliked about GK's post was it clearly
indicated he didn't buy anything, isn't going to buy anything and wants
everyone else not to buy anything. Again I suspect this is because he
tried to get the latest version and can't and has to do with a pirated
3.2 version or something. He is anonymous, (someone said there was an
identifiable address in one of his/her posts), like he's better than
the rest of us. I just generally don't like anonymous posters,
especially anonymous posters who are starting a flame attack on one of
the few 'serious' developers A8 has. I said A8 is 'dead' in a post.
From the point of veiw of A8 being a viable market for serious
developers is what I mean. Give me a break, I'm an anatomist and used
to hacking over dead things.

Cool! Thanx! I didn't NEED it. This was the only case where I've cared
about the returned value of a STATUS call - and I figured it out.

Something like this:

Byte Func ARegister(Byte X, Y, A)
Return(A)

Byte Func MyNode()
Byte N

MXIO(18,0,0) ; (Channel and "M:" are always the same, so no need
; to send them as parameters EVERY TIME!)
N=ARegister() ; No parameters; the "A" is safe
Return(N)

Oscar; nice post summing up the current situation. The only thing I would add is perhaps Derek or anybody else for that matter would be better off airing their problems in search of a solution vs flaming. For instance, I stand by my statements that Derek seems to assume just because you have some www access you automatically should be able download the files. This just isn't. A blurb about this in his web page would have/could have sent the users to their own sysadmin to find out if they were able to transfer files this way rather then going to Derek. Ditto for late night phone calls, I had this problem & others. People would be saying stuff like, "I must of called you 10 times yesterday & you never answered." or doing like they're doing to Derek, calling in the middle of the night. The solution was as simple as going out & buying a $39.95 answering machine. The people insisting they had called me numerous times suddenly stopped making that claim when they new I had an answering machine. Ditto for the late night calls, you'd be supprised how quickly peole learn what your normal waking hours are when they get to talk to an answering machine via long distance.
There's no reason to go POSTAL about this stuff, just ask how others deal with it & your liable to find out life is a game that is meant to be enjoyed. True, you do die from it, but that doesn't mean if you learn to play the game before then, it's not quite as painful of a death.
Rick

Actually, we're not sure he even has a (purchased) copy of PC Xformer.
I think the reason he starting yelling was this:

People were complaining about PC Xformer - mainly Darek's nonresponse
Darek came in, pretty much called them all idiots, and explained (harshly)
that only ONE of his e-mail addresses work now.

So - people were in a huff about no response.
Darek was in a huff because - umm... I guess it was bad press for him?
Gate Keeper was in a huff because Darek was being so harsh to the people

That's what I saw. (I saw it all in a very compressed time, having read
most of this in the last two days).

Right. He'll get the hang of it. I've found a lot of stuff that you
have to tweak with those function keys, then voila it works.

I think Xformer's compatibility is close to any of the individual
Atari 8bits by itself. You know you'll have trouble with ancient software
on an XE, the merely old software sometimes likes the GTIA chip, etc.

From the Desk of Daniel Miller, Starving Artist/Parched Writer/Amiga User

Which ones have you tried that don't run?

: version so the keys looked more like the ones in the arcade <g>)

I definitely recall fixing a few double-buffering and "non-opening
door" bugs fairly late in development. The testers had it by then, so
it's entirely likely that more than one version leaked.

On the other hand, it's possible that those bugs are in the
"released" version of SP, since Jack Tramiel swooped in around that
time, and SP basically didn't matter any more.

I think I've got the source on some old disks (an "off-site backup",
yeah) in the basement, but I don't have an 810 to read them anymore.

> Atari) running MANY different programs, from simple speed tests to full out

I am not very informed about Emulators:
Rainbow is for Macs only, right ?
Atari800 is a UNIX-Emulator, right ?

Is there a ftp-site, where I can get Atari800 ?
Who can give me more infos about Atari800 and Rainbow ?

CU and thnx,

Freddy.

Finally, you can always ask me for a copy at URL:mailto:mcurrent@carleton.edu

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, public domain software/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine; Atari Classics magazine, published by Jim Hood and Bob Woolley; and The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

4240. CD-ROM U.S. Version

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-17 00:00:00 UTC
From: Bob Klaas <bobkla19@mail.tcd.net>
Message-ID: <4b16k3$iae@news.tcd.net>
Source record: 87050

I have aquired a few old Atari 8-Bit Clubs libraries, and have been converting them to Disk Files to port to the IBM so I can create a CD-ROM.

Any suggestions as to layout and format would be appreciated.

One club, produced a disk that can not be re-produced unless a specific version of Diskcom is used. Will include that version of Diskcom on the CD.

4241. Re: Internet Software

k> to download, then reload the
k> terminal).

Hey, Bill. Not to mention my Term80. Offering 14.4k baud,
ymodem/1k xmodem/xmodem crc, ibm characters, ansi positioning, etc. It
does require that you have your modem hung off of a Black Box, or an MIO
if you are using Len Spencer's HyperSpeed program, and a HD or ramdisk.
It won't run off of floppy, or if you have your modem hung off of a sio
interface. It's a term program built like a serious bbs program,
allowing 16k external modules to be ran.

Which reminds me of a thread that was on here, about
incompatibilities between different implementations of xfer protocols.
One of the most common is that most atari-8 implementations send a NAK
at the end of a file transfer (download), to force the sending system to
repeat and confirm the EOT. Many intel programs are not robust enough.
They send the EOT and do not wait for the receiver to ACK/NAK.

This message is also a test of usenet <-> CTH BBS croIf it looks strange, that's why.

4243. Help w/BobTerm file transfers...

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-17 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <4b1t8l$gc9@sirius.cs.pdx.edu>
Source record: 87053

Hi everyone... Ok, I know this is a VVVFAQ (Very Very Very Frequently Asked Question 8-), but can somebody tell me how to get XModem or YModem transfers to work between BobTerm 1.2 and my Unix host?

With XModem, I'm using -b to force binary mode. The transfer goes OK for the first 16 blocks, then I get repeated "Bad Block #" errors on the 17th block, until BobTerm gives up.

With YModem, it doesn't even get past the first block--I get "Duplicate Block #" errors over and over on block 1, until BobTerm gives up.

If it makes any difference, I'm using a direct-connect SX212 at 1200bps with a stock 800XL, and my provider's version of sx is 2.12 or thereabouts, I think.

Please help! I'd really like to download some stuff from UMich!

Source record: 86969

Please help - we're having extreme difficulty trying to get our emails down and uploaded using the STORM software, and are having to do all the typing and reading on line. Is there a better programme, or are we really missing something; it won't print email either. We have no manuals, as this stuff appears to be shareware in Australia.

I shall be in Houston, TX shortly too, and was wondering if anyone could recommend a store there perhaps, where I could look out for some interesting software, or perhaps a better programme - this one is costing a fortune in server rates.

Please keep the reply simple, as we're very new to this :) Thanks in advence for your help.

Carrol Hall

It might be easier to get ahold of (borrow, buy, or build) an "SIO2PC" cable
and get ahold of "SIO2PC" or "APE" software (for your PC).

PC thinks it's an Atari drive. Atari thinks PC is an Atari drive.
Atari sends files to PC / gets files from PC with no problem.

Check the FAQ for details. :)

Good luck!

Keith, welcome! Just a quick note on doing hacking on Atari disks. You may want to try getting ANANDISK disk off the archive.umich.edu & its companion program DEANA. Wish I could remember who did the original hack, but I seem to be losing brain cells faster then hair. Anyway, it will tell you in the quickest/least painful way if your floppy controller is capable of reading SD disks. A lot of people including the author of UTIL had trouble reading SD disk with their existing controllers & gave up. I think ANADISK has a file that tells you how to convert a non-compatible controller to read SD. There's also a problem AFAIK with the timing holes since they aren't used on an Atari disk.

Cliff, you don't happen to live in the SF Bay Area do you? Reason I ask
is Halted Specialties has joystick mechanisms out of commercial arcades
for about $7. You would have to mount it yourself, but I bought one of
these types years ago & needless to say, it was the last joystick I bought.
It's only a minor hassle mounting it & wiring it, but once you get it
right, it's practically indestructable.

Well, late apologies for any disk problems. I remember, disk swapping being a problem with some track buffering drives. Looking back, I think the Loadstone was too cruel. The only ways to get rid of it were to toss it in the magic pit on level 1 or palm it off on some unsespecting pauper. The Devourer was no problem, as long as you didn't try to haul off every piece of junk you came across, you would only encounter one in the entire game. (Scorpia can bite me on this one, she was still ragging about this one last year in CGW.) Which was Omnimon? Was it the one that replaced the OS board? I recall that when you hit reset it still used the same page 2 data stuctures of the OS, and it trashed crucial vectors
on page 0. My solution was to use _every_ bit of RAM, and replace the OS with my own. Datasoft had a special OS board it was going to market but never did. It had 16K of RAM, and the OS was only 10K. I was able to write a monitor/slave that ran in the remaining 6K, including it's screen. It could non-intrusively interrupt any program running. It wasn't written to be a cracking tool, but I never saw a better one.

Glad AR was able to save you some dough in the long run. It's amazing what I spent in 1980's
dollars compared to now. 500 bucks for a 90K floppy drive. I balk at spending half that for 1GB hard drive.

I've enjoyed UVI and UVII. Wish it didn't force it's morality on you to win. I've also found Elder Scrolls: Arena to be very ARish.

```
#==========Cliff Lawley, 12/16/95==========
#
#I am in desperate need of a descent joystick!!! Man! Are they hard
#to find now!
#
#Of course I am a very picky joystick buyer. I do NOT want a flight
#stick. I must be switchable from 4 position to 8 position (this is
#definitely a must). It should have a metal shaft. Last but not
#least, it should have at least a button on BOTH sides (I'm left
#handed, my wife is not!).
#
#I know they exist, I used to have a couple of different ones. Kraft
#made one but it had a plastic shaft. This would do, as the one I have
#now has NONE of the things I just listed. Someone else made an ideal
#one but I can't remember who they were. It was blue and had a black
#piece on top that you used to select 4 or 8 position. It had a metal
#shaft and the buttons were on the front, not the top, if you know what
#I mean.
#
#Anyway, if anyone knows where I can get such a stick, or has one they
#can part with, PLEASE let me know!

In my opinion, WICO made the best joysticks available. I don't ever
remember one being switchable between 4 & 8 positions though. I
have a WICO at home that I use with my Atari machines (and with my
Odyssey with an adapter cable) and it has worked well for lo these
many years. WICO used actual micro switches instead of some type
of contacts on a pwb.

I also have a Kraft Starmaster joystick sitting in front of me.
I picked it
up at TRU years ago on closeout. I don't plan on parting with it at
the present time, but it isn't as well made as the WICO. Course, I
only paid $6.95 for it verses the $20 I paid for the WICO.

Don't any of the mail order places that still carry Atari software
also carry joysticks? Try ATV or Toad Computers. Check the
clearance aisle at TRU and computer stores.

You don't need to build a null modem cable. They are easy enough to find. All you need is a normal serial cable with a null modem adapter on one end. You can buy these at any computer store, or Radio Shack. Before you buy it, check which kind of connectors you need on either side (number of pins, male or female).

This is assuming you're plugging the cable into an RS-232 port on your Atari. If you are planning to plug one end into the Atari's SIO jack, a null modem cable is not what you are looking for.

The rights to both SpartaDOS and the SpartaDOS manual are held by FTe.

```
Copyrighted | Not Copyrighted
----------------------+---------------------------
commercial software | public domain software
shareware |
freeware |
```

(SpartaDOS 3.2 is shareware)

When I sent in my SpartaDOS 3.2 shareware registration, I received both the
printed manual and several disks (3 I believe). WELL worth the small
shareware fee, IMO.

4269. XF551 for sale -- best offer

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-19 00:00:00 UTC
From: dgb@owlnet.rice.edu
Message-ID: <4b6tfl$ehq@larry.rice.edu>
Source record: 86907

I have an XF551 drive for sale. I think it works; it boots
DOS 2.5 but that's all I have to test it with.
It doesn't come with a power supply but will use the ones
that come with the 1050, 1010, 800, etc, etc, etc.
It does have an SIO cable if you need one.
I'll sell for the best offer I get since I don't know
how much it's worth. This isn't an auction; just make an
offer if you're interested. Your offer should include your
shipping method of choice from Atlanta, GA. (US only please!)

Thanks. Will also trade for 8-bit cartridges I don't have--
I especially want Crystal Castles, Kangaroo, and any Imagic
cartridges.

That was never released? That's a shame... AotMK was a little gem
of a game (although I developed a serious hatred of the bottom
cannon... a relative of Tempest's Pulsar, perhaps?). Plus, the
sound effects and colors had a very Williams-eseque feel to them.
(damn, now I have to dig it out and play it!)

> There was also the UK version of Attack of the Mutant Camels on the
> '800, released by Llamasoft, which was a completely different game
> (picture Empire Strikes Back with nice DLI skies and giant camels
> instead of Walkers)...

I've got that one somewhere too, although I remember it being titled
"Revenge of the Mutant Camels". To be perfectly honest, I thought
Empire Strikes Back on the 2600 was better. The ship in your version
seemed to only have two "gears"-- fast and slow-- as opposed to the
smooth acceleration in the 2600 game.

4273. CART-CLONE ?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-19 00:00:00 UTC
From: naslund@ridgecrest.ca.us
Message-ID: <DJuozn.39y@ridgecrest.ca.us>
Source record: 86911

I just bought an ATARI 65XE and an Indus GT drive ata a garage sale
for $15. They both work great! The package included joysticks and
a lot of diskettes. One of the diskettes is a commercial program
called "CART-CLONE." Several of the programs I tried to run were
"cloned" cartridges and upon trying to load I get the following
message:
Turn on CART CLONE and press any key

I was wondering if this means that CART-CLONE is a hardware device
that plugs into the cartridge port in addition to the software I
received. Anyone have any experience with this product?

Thanks, ...Howard

Sounds like it's not really a boot disk, or the disk is corrupted or
defective. See if you can find a different boot disk.

4275. one way comm with null modem cable

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-19 00:00:00 UTC
From: bigrex@nz1.netzone.com
Message-ID: <4b5igu$mua@news1.netzone.com>
Source record: 86913

I tried both Bobterm and Chameleon and could only communicate from my PC to the Atari-320XE. I cannot get the Atari to talk back to the PC. I tried my old HP-150 to see if the null cable was bad but it worked fine. I'm using an 850 with any modem option. I suspect thats probably the problem as its expecting to see a modem. There is no direct connection option.

I ordered the EMU from B&C and want to transfer old stuff to the PC. Is there some place I can buy an APE cable. B&C said they couldn't sell them because the author of APE wouldn't let them. God is it any wonder why Atari is in the sad state it's now in. The APE author wants close to $100.00 for the cable and the software licence.

(Circlemaster says e-mail him if I want to know who he is
and mentions some of his A8 credentials.)
Circlemaster:
I think I had a run-in with you a year or two ago when
csa8 was discussing whether we should 'permit' discussions
that involved any other platform and the jist of the thread
from some people was that csa8 should remain purely Atari
8-bit and have no discussions involving relevant aspects of
other platforms. I don't recall the name, but seems like it
was sorta Italian, like DeBartolo or something.
I wasn't bitching about your anonymous 'handle', it was
the sanctimonious 'Gate Keeper' who had no address in the
header that could be replied to (I have no idea how he does
that, must be a sysadmin or something). I don't mind your
real name, if you wanna use a handle that I can respond to,
that's not what I was talking about.
I still think you're naive if you think there are a lot
(or any, actually) of programmers with better skills than
Mr. Mihocka's, still writing stuff relevant to A8. I'm not
putting your lottery picker program down, never saw it, but
a BASIC application like that is a far cry from the skills
necessary to write an A8 emulator for the PC. Not even,
say, Wes Newell's programmer that wrote the OSNXL OS for A8
compares with the sophistication required to write such an
emulator. As Kit Kimes noted, Mr. Mihocka writes software
for the most successful software company in the world, and
I'm sure he's a 'system level' programmer, not some windows
application guy. I accept your idea that PCXformer is not
sufficiently 'completed' to meet your expectations,
especially if you bought it and were'nt getting courteous
answers to your questions.
I've decided to post this to the group rather than e-mail
you.
Through this thread I've learned there are emulators for
unix and macs that work quite well. I could re-read the
FAQ, which has a section on emulators.

Egad! YOU wrote Super Pac-Man? I've always considered that one of
the BEST arcade-to-home conversions ever done on the 8-bits... making
it all the more shame that it was never officially released.

Things that especially impressed me about it were the character mode
graphics for the ghosts (I somehow glitched it once, and was treated
to the sight of clumps of ATASCII characters marching around the
screen <g>), and the *music*. The music was perfect, near as I
could tell. How did you do that? Did you have access to the
arcade source code?

What other 8-bit games have you written?

> I think I've got the source on some old disks (an "off-site backup",
> yeah) in the basement, but I don't have an 810 to read them anymore.

I'm sure any number of people would be happy to make some copies for you
(self included).

I have had spartados for quite a while (I got it from its original developer ICD). Unfortunatly my best efforts at getting it into ATR format will not work and gives me garbage in the directory. I have tried both dcmtodsk and dcmatr to no avail. If someone could mail me an ATR image that works I would be very thankful. The e-mail address is wesley@indy.net.

Thanks in advance,
Wesley

Last I checked, there's no way to use Netscape from an Atari. But
with Ice-T or Flickerterm and a connection to a Unix host, you can
still see pages that were written to be universally readable.
(I try to test my pages in Netscape, Mosaic, and Lynx, and only rarely
use any Netscape tags.)

Sadly, it seems to be a dying art....

Easiest way to do it, of course, is just to make sure it looks good
under Lynx. Then the graphical browsers take care of themselves. :-)

Legally, I believe that the copyright still exists, only it reverts
back to the author. In this case, the author has, in posts to this
newsgroup, implied that he does not object to people copying the
program (he said he would upload the source if he got around to it).
So in general, distributing old commercial 8-bit games is illegal, I
think there's good reason to argue that this is not the case with AR,
though I would suggest people buy up those copies left at the few
places that still sell it first.

Someone want to post a list of places that still have copies for sale?

JESUS H. CHRIST PEOPLE!!!!! A few weeks ago I made an off the cuff remark about how Atari users were pirates. Boy, did I get my share of email messages bitching me out about it. Probably about 50 at last count. From everybody and his brother claiming to be a goodie goodie Atari user that has never pirated a piece of software on his life.

To which my response was that fine, not EVERY SINGLE Atari user is a fucking slimebag pirate, just a WHOLE BUNCH OF YOU. And the rest of you sit by and tolerate it instead of putting an end to it.

So, several weeks have passed. Everyone has calmed down about my pirate comments and everyone is back to bitching about PC Xformer and telling me how they could all do a better job (ok folks, I challenge anyone to write a better Atari 8-bit emulator) and what happens? Some stupid shit for brains low life starts up a thread talking about pirated software. I've read about 5 messages so far tonight dealing with cracked software, where to get it, which pirated software doesn't work on PC Xformer, etc. and NOT ONE SINGLE PERSON speaking up about it to remind everyone else that is it no OK to use the Internet. What do you think comp.sys.atari.8bit is? A free forum to exchange pirated software?

I hate to tell you, but it's not. Please keep your discussions about pirated Atari software out of this forum, and then maybe, just meybe, I'll get this silly idea out of my head that Atari 8-bit users are a bunch of damn pirates. PC Xformer is not an emulator for running pirated software on. There are many many sources of legitimate Atari 8-bit software to run on the emulator. ABBUC puts out an excellent CD-ROM full of thousands of disk images of Atari 8-bit software. I'm developing a cable to allow you to run your Atari 8-bit disks on the PC, without the need of cracking them or using a piracy tool such as the APE cable (whose sole purpose, unlike the SIO2PC cable or Xformer cable, is to pirate Atari 8-bit disks).

Folks, if you want anyone else on the internet to have any respect for this newsgroup and its readers, please keep your garbage off it. I am trying to make a living selling Atari emulators and selling them legitimately. Unlike other emulators, my emulators don't require you to pirate anything. They don't infring on anyone's copyrights. I am not

pleased to see my product's name mention by some slimebag pirate.

And you guys wonder why I'm always pissed off!

: Egad! YOU wrote Super Pac-Man? I've always considered that one of
: the BEST arcade-to-home conversions ever done on the 8-bits... making
: it all the more shame that it was never officially released.

Thank you very, very much.

I might as well induldge myself a bit here. Pardon me while I set
the wayback machine... I've been meaning to do this for years, but
never really had the courage to write this up.

In the fall of '82 I dropped out of college and joined a group in
the Atari Home Computer division responsible for doing conversions of
arcade games to cartridges.

My first project was the Donkey Kong cartridge for the 400/800, one
of the 8-bit line's first 16K games. I was basically the only
programmer working on it; Mona Lundstrum did the artwork, Brad Taylor
did the sounds, and Rich Harvey assisted with some of the attract-mode
and bitmap unpacking stuff. DK took about five months to finish, and
was some of the hardest work I've ever done.

At one point in development DK was 20K, far too big to fit. I spent
a few weeks scrunching it; my roommate was always amused when I would
come home and triumphantly announce "I saved twenty bytes today!".
There were five bytes left in the ROM at the end. There is one easter
egg: You *can* get my initials to come up, but it's really hard and it's
not really very exciting anyway.

In the spring/summer of '83, Atari was starting to lose it. After
DK, I spent the next six months doing nothing. Atari management had
basically nothing but shit to give me to work on, my boss was a
complete loser, and layoffs were occuring every three or four months
(it seemed). I helped my officemate Judy Bogart write the Robotron
cartridge (she did most of the work, I just gave her little pushes,
but she gave me 25% of her completion bonus anyway).

Finally this Super Pac-Man project landed in our group. It was
better than the other horrors they'd licensed (Kangaroo and Arabian,
if you remember them). Super Pac was still a loser of a title, but I

decided "Fuck 'em, I'll do the best job I can." Since the company was falling apart, nobody was really tracking what was going on, so I got a solid nine months to work on the game and managed to (I believe) put in some polish.

Super Pac was "finished" in late June of 1984. A week or two later, Jack Tramiel bought the bits of Atari that he wanted, and that was pretty much that. [I did a lot of stuff on the Atari ST, but I'll not detail it here in the 8-bit group. :-)]

: Things that especially impressed me about it were the character mode
: graphics for the ghosts (I somehow glitched it once, and was treated
: to the sight of clumps of ATASCII characters marching around the
: screen <g>), and the *music*. The music was perfect, near as I
: could tell. How did you do that?

I didn't do the music. It could have been done by Brad, but I really don't recall.

The character mode graphics were a lark. I thought they'd work out better than mode $E, and they did, and they let me add another color to the screen.

I never thought that Super Pac was hard enough after the first sixteen screens or so. It was just attrition after that. (Doing the "hardest" level of DK's 'elevators' rack was fun -- I stuck it on a logic analyzer, slowed it down and made sure that it was *possible* to get through, then emitted an evil chuckle and shipped it).

: Did you have access to the arcade source code?

I wish! We had access to the source for Atari arcade games, of course, but I never heard of Nintendo releasing anything. We basically just played the games a *lot*, video-taped sessions, and read the "cheats" books you could buy anywhere.

: What other 8-bit games have you written?

A public-domain Centipede rip-off called Myriapede, early '82. The released version has a bug with the old 'B' revision ROMs, so I'm not sure if how widely it spread. The guy who wrote Atari's own cartridge version of Centipede [Dave Getreu] said that Myriapede was better than his own effort, and then hired me....

They just don't design computers like those 8-bitters anymore. I'd like to write PC games, but the VGA is just too putrid for words.

It soulds like 1: you have a bad disk, or 2: you have a bad drive.

Do you have another boot disk to try? If all your bootable disks fail then
I would suspect the drive-door-closed detect switch in the drive has
gone bad.

If you dont have anoyther disk I suggest you pick one up if you have
a local source. If not drop me a line and I will mail you a formatted
1050 disk w/ dos on it.

I would bet this 'CART CLONE' is a variation of a device that
was called 'THE PILL'. Its basically a cartridge that contains RAM that
can we writte to, then write-protected by throwing a switch on the
cartridge.

This allows the 'clone' to emulate cartridges by just writing the data into
the cart RAM and then rebooting the machine. The write protect was to foil
the copy protection used on many carts, that would try to erase themselves
out of memory. (which would fail if they were truly in ROM)

You can purchase one directly from me, or there are plans available in the APE.DOC
file for building it yourself.

> B&C said they couldn't sell them
> because the author of APE wouldn't let them.

Thats funny, since ive NEVER spoken with anyone at B&C.

> God is it any wonder why
> Atari is in the sad state it's now in. The APE author wants close to
> $100.00 for the cable and the software licence.

So build it yourself. :) I want $39 for the software registration which
I dont feel is unreasonable based on the thousands of hours I spent
writing APE and the Pro System you want to use.

Nobody is forcing you to buy a cable for $60. Thats ALOT, I know. Thats also
why I suggest everyone try and build on themselves for about $6.

Your right, it is amazing the Atari is in the state it is now. Im trying to change
that with APE, by writing new software and making it available at a reasonable
price. What are you doing?

(Somebody wants children's software, age 4 to 8.)
I'm following my own advice and trying to write a few paragraphs about some programs people may be interested in hearing a little about. I do believe A8 is uniquely qualified to do some children's software. I don't know about today's PC CD ROM children's software, but A8 certainly can be good for children's stuff, much more appropriate than the hand/eye stuff they ususally have to do on Sega/Playstation/3DO/Jaguar, which are not well suited to children but are designed for older kids and hand/eye happy video jocks.
I've got 3 grandchildren, ages 2, 4 and 7. Keep in mind that keeping them interested for long in any computer stuff is not easy. I've found that old reviews of children's software in ANALOG 'Griffin's Lair' has been helpful. Some of these games can be got at American Technavision or B & C Computervisions or Best, see vendor list for phone numbers.

CBS Muppets series:
The most impressive graphics and sound I've seen are the CBS muppet series. These are probably pretty much no longer available from legitimate sources and require a keyboard overlay to use, else you have to figure out what keys do what yourself. These include Big Bird's hide and seek, Cookie monster lettergoround and Astrogrover math. Although excellent sound and graphics, they don't hold my 4 and 7 year old's interest and my 2 year old does like the graphics and sound pretty good, but he can't do much but bang on the keyboard (every parent seems to think their 2 year old should grab the keyboard and program an OS or something.)

Ducks Ahoy:
This one only runs on an 800 as far as I know. No translator will work. A really good concept, good graphics and sound. Basically move your boat around Venice and catch the ducks before they jump in the water. Line up your ducks on the wall until you get 10 of them and start all over. Hold interest for 4 and 7 for a decent amount of time.

Dr. Seuss mixup and other mixemup puzzle types:
These hold the interest of my 4 year old pretty well for a while. She can get the idea of pushing the fire button to mix the pictures up and how to use the joystick to

put the pictures right.

Trains:
For older kids, but I put it in kids games. Requires a good intellect to use.

Face Maker and Creature Creator:
Hold the interest of 3 to 6 year olds a short while, not a real winner.

Colorosaurus:
Hold interest only briefly. The only one where the kid sorta paints things with the joystick.

Tink-Tonk series (Tink's adventure, Tinka's mazes, Tonk in land of Buddy Bots):
These are fairly good at holding 4 year old's interest. They all are basically games where you use the joystick to move the man/girl around in the scenery and occasionally come on monsters or letter or number games.

Hodge Podge:
You hit a letter and a picture and tune plays. Basic alphabet. Good with Muppets Learning Keys (a special keyboard laid out in ABC instead of QWERTY keyboard.)

Grandma's house:
Pick a character (little girl most favorite) and go to town, beach, store and get stuff and bring it back to Grandma's house. Use joystick to move your character. This one has probably held my 4 and 7 year old girl's attention the most. Almost like playing with a doll house.

Math Encounters:
Haven't used this one yet, 7 year old's skills in math are still not quite up to this level. Has nice graphics and good playability in addition, subtraction, mult., div.

Some real Losers:
Olin in Emerald, Fraction Fever, Monkey News, Soft Toy, Kids on Keys, Kindercomp and Dragon Games.

Ok, so I tried and I know this isn't really telling you what's going to be good with your kid. My 4 and 7 girls are getting up there where PacMan is interesting to them and they can do the joystick and avoid the ghosts for a brief while, probably never clear a screen. The main thing to remember is that kids do want to do stuff on the computer, but don't have a lot of skill and probably won't stay interested very long and you'll have to participate with them.

Comp.sys.atari.8bit is probably one of the most "legal" newsgroups
there is when it comes to piracy. We've seen the discussion a million
times on copyright laws and such.

Most of the time when people talk about cracked copies, they do own
the original. (And if the don't, they can ask and somebody will tell
the a reasonable source for it.) I know this is a pretty naive few of
the world, but it is how I view it. If someone comes on this newsgroup
that he has cracked copies of everything for the Atari, I'm sure he
would be sorry he did. (Is Vladimer(sp) still around?)

>Folks, if you want anyone else on the internet to have any respect for
>this newsgroup and its readers, please keep your garbage off it. I am
>trying to make a living selling Atari emulators and selling them
>legitimately.

Now if you were trying to make a living from selling Atari emulators,
you wouldn't be working at Microsoft, would you?

>Unlike other emulators, my emulators don't require you to
>pirate anything. They don't infring on anyone's copyrights. I am not
>pleased to see my product's name mention by some slimebag pirate.

None of the other emulators require you to pirate anything. They do
require you to find an Atari from where to copy the ROMS.

Anyway, I thought imitation was the sincerest form of flattery!! :-)

Its sole purpose is to allow users to create solid, useable, DURABLE
backups of thier protected software. And it does a very good job of it,
as promised. Dont drag my name or product into your petty, juvinile
flame war.

Source record: 86933

Dan; Omnimon was the OS from Newell Industries. I got turned on to it
by Bruce at B & C Computervisions early on. Since I'm a hack, it really
saved/educated me about flaws in my code. I would frequently write
something that would just hang and require a cold boot. With
Omnimon I could recover to the monitor & it would tell me the
current program counter so I'd know where I hung. It also had a
lot of nice features like built in sector editor, assembler, tracer,
memory editor, whatever. *BUT* it sounds like your ROM was a better
solution for cracking stuff. In my life, I doubt if I've cracked more
the a couple of titles, Ultima III because I wanted to play it off
an ATR8000<damm timing holes>, Montezuma's Revenge<Copy protection
wouldn't boot with a US Doubler!>, and a few cart titles when the
carts started going south on me. I guess life's to short for me to bother
cracking titles I already own for the sake of cracking them.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <149057@cup.portal.com>
Source record: 86934

Rick; For any equipment including 2600 carts I'd reccomend going to
Goodwill, Salvation Army, or any thrift shop. Going prices of carts
for any system is $.99 to $1.99 for carts. Equipment prices are
roughly $3 to $25 for items ranging from 2600s to 800XLs.

From: virtual@ixc.ixc.net
Message-ID: <4b9pcv$c3@ixc.ixc.net>
Source record: 86935

Hi. I have the following for sale:

Atari XE (Is that also a GS?)
with detatchable keyboard, light gun and manual.
2 "Hot Stuff" Joysticks. These have 4 buttons, 2 on the
base, one on the trigger, and one on the thumb.
1 GemStick
1 StarMaster 2 button stick
2 Power Supplies for consoles, both working
16 catridges (some dupes), including:
Dig Dug (2)Star Raiders (2)Bug Hunt (gun game)
Qix Q*Bert (2)Final Legacy
Asteroids Joust (2)Flight Simulator II
Pac-Man Basic Ms. Pac-Man
Centipede

Built in to the unit are Basic, and Missile Command,
and several self-tests. I've personally tested all
this equipment, and all the hardware works great.
Some of the cartridges need the cards cleaned
(they don't always make good contact), but I've tested
them all. Also, please note that this unit does not
play Atari 2600 cartridges. It plays Atari 400/800/XE
and GS cartridges. BTW- This is a cool looking unit,
it's gray with big pastel select/start/options buttons. %)

I'm asking $40 plus shipping or better offer.
I'll be more than happy to ship COD.

The serial ports on the Atari expansion/interface box don't provide all
the signals the PC may expect. I think I had to placate the PC by
connecting DTR and DSR. Null modem cables may not always do this.
The way they make cables these days you can't easily open them
up and make such "corrections." I ended up buying an "RS232 jumper kit"
and soldering jumpers as required. Any book documenting RS232 pin
assignments should provide enough info to do this.

It hasn't been turned on in about 2 years so I guess it's time to get rid of the whole thing. I have a 130XE, with a Superarchiver 1050 disk drive, a Comadore 1702 color monitor, and a single switched & fused power supply to drive everything. I probably have an 850 interface also, an extra stock 1050 disk, and an extra 130XE. Includes misc joysticks, and lots of software. I did turn it on just to verify everything still works. The whole thing is in Santa Rosa, California and would prefer to sell it locally. Will ship if necessary. How about $150.00 for everything. If interested, drop me a line and I will do a complete inventory.

Rick - Thanks for the info!!

I'll grab those files (hopefully before
Christmas). Who knows with my schedule.. I've started working with the
UTIL.C / ATARIO.ASM files that came with the util.zip.. I don't know
what version of C or what assembler they were done in, but there are some
wonky non-standard commands in there! (But I'm a programmer -- I'm
having fun anyway!)..

Could somewhere post the location of the files DCMTOATR / DCMATR that I
keep seeing fly by every couple dozen messages or so!? In all honesty,
I'm more or a source code guy - don't really need the executables but if
no source is available I'd rather get them than the bunches-o-nothin'
that I've got now!

Thanks!

4319. Old Atari Comm. Software

Message-ID: <149065@cup.portal.com>
Source record: 86944

ARGHHH! You would ask me a question I would have to look up!
BTW: Rob's method using BYTE ARRAY is probably the only cute exception
to the rule 'always give a size when you dimension an array' that I've
seen. I've done the thing with TYPE since you can access the individual
I/O control block without having to calculate the IOCB times 16, if memory
serves. Everything is automatic if you access the IOCB in the structure.
But I think you are right about the STATUS, AFAIK Y is only loaded if
you have an ERROR.
BTWII: Wouldn't you really rather do this with a code block anyway?
IMO: This is one of those rare cases where you would routinely call
the PROC, size would be smaller, & it wouldn't take up as much of your
valuble symbol table space.

4323. Re: Alernate Reality on Xformer

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-20 00:00:00 UTC

Derek: For what it's worth, Dan Pinal is the author of AR The Dungeon.
I'm sure you well get a number of posts about this, but the reasons
everyone is bending over backwards for him are:
1) He's a great programmer
2) He seems to be a nice guy
3) If anybody has a rigth to request if someone can find him a cracked
copy of The Dungeon, I could not think of a more deserving person then
the author of the software.
You really need to relax. I don't really wish you ill, but what if you
lost your copy of Xformer and asked for someone to send you a copy?
Would you appreciate being called a pirate & thief by Dan? As far
as the APE cable being a pirate device, that is just complete BS. *IF*
someone wanted to, I'm sure they could hack your printer cable to do the
same thing. Does this make your cable a pirate device?
Further, I don't know if you recall, but I offered to design & make
a serial based cable for you & your emulator. It was your perogative
to ignore the offer, it just happens Steve saw the post & took me up
on it, that and a lot more. For that matter, if anyone was so inclined,
I'm sure they could use a sio2pc cable to do the same disk copying as
APE.
I find the language you are using offensive and your accusations unfounded.
You must be planning a move to the Micro Soft Net in the near future since
you really seem to be trying to burn your bridges behind you. You should
really read your service aggreement with halcyon. I would be willing to
bet there is a clause about inappropriate posts.
If you really feel the need to flame like this, take it to the
ST group, they love it over there and are much more likely to try
give you a good argument. Here you are just fighting with people
that are trying to help.

The problem you are having is that your text files are
in ATASCII format, instead of ASCII. There are a number of Atascii->Ascii
converters at archive.umich.edu.

I know there is one in the SIO2PC archive, and APE has its own built in
Atascii browser.

Not to diminish your accomplishments with Xformer, but have you seen
Rainbow?

Or are you just talking about an emulator that runs on a PC?

The fact that no emulator yet does a perfect emulation of 15 or 20
year old hardware on modern hardware says a lot about the original
design...

#
#
#JESUS H. CHRIST PEOPLE!!!!! A few weeks ago I made an off the cuff
#remark about how Atari users were pirates.

Sorry to hear that you had such a negative response. My impression
is that most of the people left here are pretty responsible users
who still buy software when they can. As mentioned, there are still
a few legitiment sources for 8bit software although there
are probably
a lot of games that just aren't available from any
legitimate source.

#So, several weeks have passed. Everyone has calmed down about my pirate
#comments and everyone is back to bitching about PC Xformer and
telling me
#how they could all do a better job.

Easy Darek. I think that I have read every message posted here and
I don't remember anyone saying that they could do a better job. A
few complaints maybe, but no comments like "I could do a better
job with my eyes closed". :-)

#PC Xformer is not an emulator for running pirated
#software on. There are many many sources of legitimate Atari 8-bit
#software to run on the emulator. ABBUC puts out an excellent CD-ROM full
#of thousands of disk images of Atari 8-bit software. I'm developing a
#cable to allow you to run your Atari 8-bit disks on the PC, without the
#need of cracking them or using a piracy tool.

I am anxiously awaiting you cable. I did email you that I
wanted one of your cables when they are available. I hope
that you have my name on your list.

Is there a list somewhere that describes all the different 8-Bit
machines by Atari?

For now can someone point out the differences between a 1200XL and
a 130XE. I know that they can both play the 400/800 carts, but beyond
that and there physical difference that's it for me.

Wow! Thanks for the history!

DK most certainly was one of the best arcade adaptations there was. I STILL play it. In fact, I think it was the first thing I played after re-hooking up my 8 bit again last month!

You certainly are a GOOD programmer, especially for doing it from just playing the game! Did you have a hand in DK Jr? It was pretty good as well.

Some other awesome adaptations....

Hello. Looking for some help on Sparta Read, which you use your IBM compatible to read spartados disks in double density. You then can copy files from that disk right onto your ibm hard drive. Well when i tried it, and it would say OK! when copy was complete, i'd read the file from the IBM hard drive and it would not format text files right. How would i get the files to copy right so they could be read without cents signs between each word?

please reply...

I guess in other words, i'm tryin to figure out how i would toggle between a text file copy and a binary file copy, like on the UTIL file.

thanks

The 1200XL came with 64K of RAM, and the 130XE with 128K, although either model could be upgraded to 256K or more. (Anything beyond 64K is used as ramdisk, or can be used as buffer space for some programs such as the later versions of Textpro). The 130XE has Basic built in. Another very important difference is the ECI (extended cartridge interface) port on the 130XE. Atari never made anything to plug into this port, but you can buy a Black Box or MIO interface and connect a hard disk to the 130XE.

: that and there physical difference that's it for me.

My "Unofficial Atari 8-bit New User, Emulator Help" FAQ has a description
of the main machines (ie, not the vaporware). Hopefully they're accurate. :)
Find it at:

http://zippy.sonoma.edu/~kendrick/nbs/new_and_emu.html

(BTW folks, my home page is messed up because it depends on some CGIs, but
since this system took hard drive nose dive, some stuff is missing and CGIs
don't work. The best way to get to pages that show up as garbage is to
use the "Big Index" available from the main page (.../~kendrick/))

Anyway.. the 130XE has 128K of memory, the more standard OS, and an ECI
port. (Extended Cartridge Interface) I'm actually not sure how compatible
to a PBI port (on the 800XL and 600XL and I think 800XE) it is, but at LEAST
one PBI device (the "Black Box" hard drive / printer / modem interface) works
with it. It also has BASIC on ROM inside.

The 1200XL has only 64K. It has a funky 800XL-like OS which refuses to run
quite a few European programs (they do some funky stuff in their code :)).
It has no PBI or ECI port. It has no BASIC inside (yay!). Also, ONE other
difference that's notable (between 1200XL and all other 8bits) is it has
a resister on part of the SIO port - some hardware (namely those which don't
have their own power supply) won't work with the 1200XL because there's no
juice to draw from the thing. "Fixing" this is a cinche.

Good luck!

Russ, I must say, that was a great (and useful) post!

The little girl next door likes to come over and mess with my computer (and legos :)). She gets a kick out of "The Noisy Giant" (PD storybook). It's her favorite. She can't read, but likes the pictures. (Oddly, her favorite is when the giant is crying. Hmmm..)

Perhaps it's time to look into some of this commercial stuff for her (and hey, I'll have kids one day too! And, since I'll be using Atari 8-bits until (and possibly beyond) the grave...)

Cool! I just recently hooked one of my spare Ataris to the TV, and
this is the game that gets played the most!! However, my joystick
skills aren't as good as my brother's, since I can only get to around
65,000 points, while he is in the 150,000 range.

Thanks for such a great conversion!

BTW, I'm sure most of us hear would love to hear more stories of what
went on at Atari.

Wow, I didn't think anyone was actually still using this...

>How would i
>get the files to copy right so they could be read without cents signs
>between each word?

Well, SpartaRead won't do any special conversions on files.
I wrote it as a simple test a long time ago and never really finished
it. You could take the file and then run it through another utility
to convert the cents signs into carriage returns, or you could run
it through a 'search-and-replace' operation in a word processor.

I've still got the source sitting around here somewhere if anyone wants
to finish it... (although it's embarrasingly bad - my first C program).

As recently as mid-1994, Kraft was still in business, still available at the phone number listed in whatever ancient issue of Antic reviewed joysticks 'way back when, and still selling Atari 8bit -compatible joysticks via mail-order. I intended to buy a couple, as mine were my favorites (I had Atari, WICO, Kraft, and a few other off-brand sticks) before they got broken -- but I never got around to putting in an order (sigh; the story of my life). It's anyone's guess as to whether Kraft is STILL at it, but if you've got that old issue of Antic, give 'em a call and find out. And then tell us, here, about the current state of affairs!

I might actually try to dig up the phone number and repeat my mid-1994 investigation, now that the subject has been raised anew... If I get anywhere, I'll let y'all know, too.

How many working used 800XL's would you like? I have several with power supply and video cable. Stock 64k, $29.00 postage included...Guranteed to work.

Now you have your MUX, go out and buy some contact cleaner, you will find that they get coroded and need cleaning..when this happens you will loose data and the machines will lock up. Keep them clean and you have many hours of worry free service..

That's actually a bit too high for me, for a 64k machine. I guess I've been spoiled by a $35 quarter-megger and a freebie stock XL. :) I'll keep them in mind if I find I have spare cash after this Christmas. :)

Thanks for the tip. Why is this? And what does one do when/if the actual female connectors get coroded? Or is this what you meant? I stick to a good old pencil eraser for the male connectors. (Man, they get dirty!)

The easiest way is to just use a global find and replace function from
within your favorite word processor. There IS a program for the Atari
that will convert between ascii, atascii, and the other platform
equivalents. I went to my 800xl [hasn't been fired up in months] to
check the program name, and the keyboard won't respond. Sorry. My
other 800xl is packed away in attic. I think the program came out
around 1990, and is probably available yet on GEnie. Wish I could be
more help.

Sure, I have both 1200XLs & a 130XE. The 1200XL preceeds the 130XE by a
couple of years. It was the first major rewrite of the OS which made
it incompatible with some of the early software. It also deleted
the 3rd & 4th joysticks. Everyone rates its keyboard as one of the best
ever used in a home computer. The 130XE was broght out after Atari changed
ownership. It is a much more powerful computer in that it has 128k of ram
vs 64k for the 1200XL. The down side is the keyboards under new managment
were cheap at best. The other added features include built in basic and
the (E)nhanced (C)artridge (I)nterface that allows you to hook up hard
drives, printers, and serial devices. If you just want a plug & go computer,
the 130XE is the way to go. If you just want something to plug game carts
into, either one is fine, if you want something to hack the hell out of, you
can add all the features of the 130XE to a 1200XL. The latter is the route
a lot of us have chosen to go. It isn't cheap if you buy the upgrade parts,
for instance, I think memory upgrades still go for about $30 & last time
I checked, new 256k ram chips were still about $2/each. This makes a modified
1200XL more expensive then a mint 130XE, but then I don't ever recall seeing
one of these modified 1200XLs for sale. People get rather attached to them.
Which reminds me! Anybody got a 1200XL keyboard they want to let go?
Rick

No, I'm not looking to start a flame war, but this just made me wonder... Put an end to what? As a former Atari 8-bitter, I ask - are there any producers of commercial Atari 8-bit products left? I would imagine they're all gone by now. In 1990, when I put my Atari aside, the only I knew of were a very few in Europe; and 3 or 4 mail-order suppliers of imports, used/refurbished/excess inventory stuff (ie - B&C, Toad...that's all I can recall). While I am currently against rampant piracy of currently available titles, what the heck difference can it possibly make anymore if people trade old Atari programs that haven't been on the market for 10 years? Again, I'm not looking for flames - I'm asking in a serious tone.

> everyone is back to bitching about PC Xformer and telling me
> how they could all do a better job (ok folks, I challenge anyone to
> write a better Atari 8-bit emulator)

I think someone did. It's called Rainbow, and there's *very* few things I've found so far that won't work with it. (True, some have choppy sound, and it doesn't run so great on slow machines; but you can play stuff like Alternate Reality just fine on it...provided you have a cracked copy, of course :-)

4362. Classics forsale (Intv II, Atari 1200, C64c, TI)

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-23 00:00:00 UTC
From: jap5r@virginia.edu
Message-ID: <DK0qz4.CtI@murdoch.acc.Virginia.EDU>
Source record: 86884
Cross-posted to: rec.games.video.classic,rec.games.video.marketplace,comp.sys.ti,comp.sys.cbm,comp.sys.atari.8bit

I have the following systems to sell.

Intv II with 10 carts (some with boxes, docs overlays), includes a genuine Mattell Intellivision II power supply. One of the numbers on the keypads is missing, but it works does come with some overlays, and the cords are are little stretched, $30

Atari 1200XL with power supply, $20

Commodore C64c (the white one) with power supply, and 1541 disk drive with serial cable connect to the commodore. Will also include some disk software and some misc floppies, $40.

TI 99/4a beige model, with brown vinyl protective cover, power supply, video modulator, two joysticks (attached to one cable), voice synth unit, 10 modules and Best of 99'er book, also includes some manuals/docs/misc books/etc..., $30

TI Extended Basic with manual, $8
I may also have some spare power supplies and modulators for the TI, ask or make an offer if you want one.

Tandy CoCo items (see webpage for list)

All systems only include what is listed with them, don't assume that it includes something if it isn't stated. When responding, please include your zip code so that I can tell you how much shipping will be.

>

I'll send it - just want to check on one thing. You want the *XL* ROM? I ask only because the demo version works only with the original 800 ROM. To use the XL ROM, you need to get the registered version.

But if you do indeed need the XL ROM, let me know and I'll attach it.

4364. Need Alternate Reality Songs

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-23 00:00:00 UTC
From: pfuchs@dimensional.com
Message-ID: <pfuchs-2312950245220001@p23.pm-1.dimensional.com>
Source record: 86886

Howdy. My friend Brian and I are a low-fi band named the Eupeptics, and for our next CD, we want to do the songs from Alternate Reality: The City, and maybe The Dungeon. However, here's the problem. Neither of us still has our Atari 800s (aargh,) and so we can only remember bits and pieces of the songs. So anyway, here is my plea, directed towards any Good Atari Samaritans out there. If anyone could tape the songs and transcribe the lyrics to (definitely)
The City and (if possible) The Dungeon, I would be eternally grateful. I would be willing to give whoever did this $20 to cover the tape and time - it ain't much, I know, but we're trying to save up for a little studio mixing time. I
would also give whoever did this 10 copies of the album, as well as profuse thanks in the liner notes.
Anyway, if you can help, please respond soon. I'm leaving to go record with him on January 4th, and so if I could get it by then, that would be great.

Thanks,
Jesse Fuchs

Boot Error
Boot Error
Boot Error
...

...when the drive is spinning, usually implies that DOS is not being
loaded off of the floppy (provided that the power-up sequence is observed,
drive, then CPU). Possibly your DOS disk could have become corrupted.
Another possible cause might be a faulty connecting cable. Make sure that
the connector is pressed in firmly on both sides so that it is flush
against the port and doesn't "wiggle". Try using another disk with DOS on
it, or another cable, another drive, or even plug a datasette in to test
that the SIO port is functional. Having the BASIC cartridge in place
shouldn't matter. The drive will spin and then the screen will say
"READY". Maybe there is a problem trying to read the BASIC cartridge.
Perhaps the contacts on the cartridge have tarnished. Trying booting of
the disk drive without the BASIC cartridge installed. As DOS is a binary
program, it should load! If it loads, then you should next try cleaning
the oxidation off the ends of your BASIC cartridge connector. Good Luck!

AC> Asked Question 8-), but can somebody tell me how to get XModem or
AC> YModem transfers to work between BobTerm 1.2 and my Unix host?
AC>
AC> With XModem, I'm using -b to force binary mode.

I believe that binary transfers are assumed unless the "-a" flag is
used. This --IS-- XMODEM we are talking about, not FTP. XMODEM was
--DESIGNED-- as a binary transfer protocol from the beginning. I don't
know what you use a "-b" flag for....

AC> The transfer goes OK for the first 16 blocks, then I get repeated
AC> "Bad Block #" errors on the 17th block, until BobTerm gives up.

If "0" is the first block send, then "F" is the 16th block. "17"
would be when "F" rolls over. It looks like the counters aren't
synchronized within the packet.

AC> With YModem, it doesn't even get past the first block--I get "Duplicate
AC> Block #" errors over and over on block 1, until BobTerm gives up.

It sounds like your CRCs aren't matching up. The "-b" flag might be
forcing a 32-bit CRC. Try using the "-o" flag for a 16-bit CRC. Also, add
the "-k" flag to limit the packet size to a non-streaming 1024 bytes. If
you do this than everything should be "-ok". Okay? If you are sending
ASCII text and need to ranslate between UNIX <LF> and Epson <LF><CR> pairs,
then add an "-a" flag and everything will be "-aok". Is that ay-okay with
you?

AC> If it makes any difference, I'm using a direct-connect SX212 at 1200bps
AC> with a stock 800XL, and my provider's version of sx is 2.12 or
AC> thereabouts, I think.
AC>
AC> Please help! I'd really like to download some stuff from UMich!

Good Luck!

P.S. My problem is that I get duplicate terminator blocks when I upload via
YModem (but that is another story... I do not know if a "-b" switch would
help me in that instance).

4368. Re: AR - I have a cracked copy

Newsgroup: comp.sys.atari.8bit

Just wanted to let folks know that an IRC channel does exist, and has existed for about a year, for the discussion of Atari 8-bit computers. If you have access to a Unix host then you should be able to get to irc by typing irc at your shell prompt and jumping on an EFnet server (irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there, and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if they have gotten that far -- are familiar with IRC, :) and select one of the servers and join #atari8. There is many IRC servers on EFnet, chances are the one your on is on EFnet.

> that put it out was called artworx

Yeah! That was one of the strangest game concepts I've ever encountered.
It was like a cross between a motorcycle game, an RPG, and Zaxxon. <g>
Even if it had been well-programmed (which it wasn't entirely) it would
have been a hard sell. As it was, I think people just said "HUH?"

Oh well.

Speaking of Artworx... anyone here NOT remember Strip Poker? Geez,
imagine if they had had ColorView technology back then!

True it has got XFD's. But it also has the same files as ATR's as well. Also heaps of other stuff for
pc and some for st for the 8bit eg xformer, sio2pc ape etc.
There is also over 700 ams files on it as well........

Synapse really knew how to make quality 8-bit games.
My favorite was Blue Max, a smooth shooter with
a Zaxxonesque perspective.

I don't remember if Synapse is the publisher, but
Necromancer was one of the best adventure games
I've ever played.

As for Shamus, I suck at the game so I never got
far enough to see if there was an ending.

Atarians:

Ok, I'm finally (after lo, these many years) getting rid of my much loved, but lately unused Atari and extras.

Whoever wishes to acquire some of these antiquated, dare I say, classic artifacts, make an offer. Best (or soonest or only) gets his/her pick of:

Atari 130XE
In original box! Wow, and the original manual! Runs great except that the cheaply-designed keyboard is finally going out. Actually, it just needs the plastic contact sheet inside the keyboard replaced. Cords and 2 power supplies.

3 Joysticks
Wico ball-topped
Wico standard
Suncom Tac-3 (like a flight simulator joystick)

1050 Drive
Still running strong. Cords/power supply included)

300 baud modem
Supra Atari modem (in box) Connects to joystick port

Cartridges
PacMan
Defender
Centipede
Gateway to Apshai
Basic

Plus, 180-odd disks of games, utilities, and the usual miscellanous junk.

And for what it's worth, a box-load of old Compute, Antic, and Analog magazines. Egads, I can't believe I still have these :P

Offers on all or parts. We can work out shipping/payment arrangements later.

Thanks!
simon

I also have an Atari 800 that will not boot. It works fine otherwise.
My problem is not the disk. I used my original system disk that will
boot by 800XL. I have tried different cables as well. I may need to
make some adjustment somewhere on the main board, but do not know where.

4388. Re: WANTED: Some documentation .

I'll give the manuals my best shot, the disk is a may be a little tougher.
When we had that storm on the West Coast, part of my roof blew off & it
resulted in a lot of wet disks. If I don't send an NAK via email, that
will mean something is coming.
Rick

My favorites are Fort Apocalypse, Survivor, and Drelbs (definitely an original). Synapse titles were generally very good - original, imaginative, and with a good mix of cool sound/graphics and involving gameplay.

What ended up happening to them?

4390. Where can I buy these Epyx games?

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-24 00:00:00 UTC
From: mgfrank@acsu.buffalo.edu
Message-ID: <4bid7s$987@azure.acsu.buffalo.edu>
Source record: 86903

Does anyone know where I can buy the Marc Russell Benioff series of Epyx games, namely King Arthur's Heir, Escape from Vulcan's Isle, Crypt of the Undead, and The Nightmare? Best, B&C, and Discount Video Too don't have them.

For that matter, if anyone has a good source for the earlier Dunjonquest and Starquest Epyx games in general, please let me know!

And while I'm at it, I might as well ask about a couple of non-Epyx items too:

Where can I get back issues of Creative Computing magazine?

Were Reptilian and Slamball by Synapse ever released? I've seen entries for them in Synapse catalogs, but don't recall ever having seen them in stores. Reptilian in particular looked like it had pretty nifty box art; I'd sure like a copy of the box or a poster, even if the game wasn't released. :-)

Thanks!

> come home and triumphantly announce "I saved twenty bytes today!".

What features (if any) did you end up having to drop? I was impressed that the "jumping around on the girders" and "how high can you get" bits made it in. Looked as though Kong's animations could have stood some double-buffering though. Oh well. Have you ever seen 7800 Donkey Kong? ARGH!! My GOD is it bad!

> There were five bytes left in the ROM at the end. There is one easter
> egg: You *can* get my initials to come up, but it's really hard and it's
> not really very exciting anyway.

Like the little dot in 2600 Adventure was exciting? Come on, give it up!

> (it seemed). I helped my officemate Judy Bogart write the Robotron
> cartridge (she did most of the work, I just gave her little pushes,

Ugh. No offense, but Robotron's animation was so lo-rez, I almost thought it was running in character mode. Ever played a Robotron clone called Arena 3000? Proves you can do MUCH better on the 8-bits.

> if you remember them). Super Pac was still a loser of a title, but I

Hey now! <g> Super Pacman is actually my favorite sequel. A lot more innovative than Midway's "more of the same" sequel, Ms. Pacman.

> falling apart, nobody was really tracking what was going on, so I got
> a solid nine months to work on the game and managed to (I believe) put
> in some polish.

It only took you 9 months?!? Egad-- Defender 2000 took Jeff Minter over a year, and that's considered quick. What would it take to get you into Jag development?

> The character mode graphics were a lark. I thought they'd work out
> better than mode $E, and they did, and they let me add another color
> to the screen.

Plus it let you avoid Ms. Pacman's (and Jr. Pacman's... another unreleased goodie) hideous flickering ghosts, and devote all the PMGs to "Super" Pacman.

> A public-domain Centipede rip-off called Myriapede, early '82. The

> his own effort, and then hired me....

I've seen Myripede. It's a nice piece of work. And I've seen Centipede.
It's... not. Fortunately I've got a port of the 5200 version of Centipede,
which is about a million times better. I don't suppose you had a hand in
that?

> They just don't design computers like those 8-bitters anymore. I'd

It can by using the ST Xformer emulator. The author of that program,
Darek Mihocka (brasoft@halcyon.com) posted in this newsgroup just a few
days ago. You can download ST Xformer from his web page
http://www.halcyon.com/brasoft
The name Brasoft doesn't refer to women's underwear, it's short for
Branch Always Software, as you'll see on the web page.

It's been my understanding that the luma/chroma outputs on an Atari are
compatible with S-video; you just need to find or make the proper connector.
I don't know the pinout of the S-video connector, but I'm sure someone
here does.

Does it say "BOOT ERROR", or does it do something else when you try to boot?
The 800, unlike the XL and XE models, is made of several circuit boards.
Over the years it may have developed a loose connection somewhere. You
might open it up and check that all the boards are plugged together;
maybe unplug them and put them back in (disconnect the power first!).

They were bought by Broderbund back around 1987. Too bad, really,
since Broderbund never released any titles which were half as
inventive as, say, Alley Cat. I'd love to see a CD-ROM version of
that game - the graphics and sound could be hysterical.

Yeah, I've done it. You have to be using an Atari 8-bit that produces true "S-Video" (some don't). The 800 did. Below is my crude diagram of the 800's monitor jack, a 5-pin DIN port.

3 1
5 4
2

I'm using a True-Type font in my newsreader, so the alignment may be a little off. Anyhow, pin 1 is the composite luminance, pin 2 is ground, pin 3 is the audio output, pin 4 is the composite video and pin 5 is composite chroma. The "S-Video" pins are the chroma and luma pins. Standard composite video comes from pin 4.

In order to build a cable, I got a 5-pin DIN connector from Radio Shack, and used Nintendo's S-Video connector for the SNES for the cable/S-Video plug. I just hacked off the custom Nintendo end of the cable and wired in Radio Shack's 5-pin DIN connector. Of course, this was several years ago, when S-Video cables were hard to find. These days, I'd imagine Radio Shack stocks those as well.

I found that the video quality improved quite a bit with S-Video, the sharpness of the image in particular, however, my friend's old 800 had some sort of fault in its video system which was only evident thru the S-Video connection - some sort of color noise that would come and go. I had seen the same thing, years before, on another friend's 800, but on that machine it could also be seen thru standard composite video. On this machine, the standard composite video was clean.

I've been told that the 800XL produces the cleanest S-Video of all the 8-bits, but have never been able to test it. Good luck if you do decide to build the cable. Looks like Atari was 10 years ahead of its time in this feature as well . . .

I agree 100%, I liked Drelbs as well. Necromancer was hard but awsome graphics, Pharoh's curse, Ft Apocalypes, Shadow World, and Protector II were some of my favorites. Blue Max was just so so but I guess in broke some new ground as a 3D scroller instead of just horizontal scrolling.

In article <4bikpe$lbp@news.rain.org>, glenng@rain.org says...

The mortal Robert Pinnegar wrote:
: Sorry if this topic's been raised before, but does anyone remember these
: two pieces of vaporware, the Atari 1400XL and 1450XLD? I was leafing
: through some old issues of Compute! a few months back and ran across a
: reference to them. Were either of them ever actually made available to
: the public? (Any inside story, Landon?)

Yes, they were sold mostly as motherboards only after the Warner demise.
A surprising number of motherboards survived--probably several hundred by
my uneducated guess. Most of them, however, were plowed under for
tax-writeoff purposes. From today's perspective, the only thing these
machines had that would be considered unique today is the speech chip.
And as far as I can tell, it was integrated poorly into the motherboard
(no speed or tone controls possible). Everything else they could do can
be done by any XL/XE today if properly upgraded. They were, however, the
best overall 8-bit from the factory in that they had the best keyboard
(1200 variety), Basic builtin (revision B--yeck), true XL OS, PBI
(incompatible with the Black Box unfortunately), and a now-useless 300
baud modem accessed through the T: devicename. These machines are often
improperly grouped with the 1200XL. They look like them, but they are
essentially true XLs in a 1200's case.

I have a 1400XL myself and if I'd use it as my main machine if I could
trust someone to give it a RAM upgrade and if I could get the PBI to work
right.

Heck, I'll just post the source code for Myriapede. I picked up a
1050 at B&C on Friday, and to my delight, these 13-year-old disks
appear to be readable. It'll take a couple of days to get this stuff
transferred.

Be forwarned: this was my first game, written when I was in college,
using a 32K Atari 400 and the Assembler/Editor cartridge. It's a
putrid, chaotic and virtually uncommented spaghetti-ball of assembly.
[There's little incentive to add comments when you're plinking away on
one of those membrane keyboards.... :-)]

Patching the binary might be easier. At least binaries don't lie.

I'making a break from SeaFight (since there's nothing more I can do with it
at the moment - hopefully I'm not running out of memory too quickly, either!)
and started working on "Punks", a Lemmings clone.

The only Lemmings thing I've seen for the Atari 8-bit is the A.R.G.S. demo
called "Lemmings". I know there's "The Brundles", but I've never seen it,
I believe it's commercial, and I've never seen any screen shots (HINT HINT).

To be honest, I forget exactly all of the types of Lemmings there are.
Diggers (left/right digging), Burrowers (downward digging), Stoppers (deflect
other lemmings), normal lemmings, ... what else?

Anyone with some ideas (or who remembers what else the original Lemmings has)
please e-mail me! (kendrick@zippy.sonoma.edu) :)

Thanx!

Happy Holidays, btw!

4407. Making Atari 800/XL/XE emulators a little easier ...

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-26 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <4bprvr$laj@nuke.csu.net>
Source record: 86829
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

Getting sick of typing when you want to load a game or program on your
(emulated or real) Atari ??

Want a program that lists what programs and subdirectories are available
and lets you navigate them and load the programs with one keypress?

Then get "File Selector v.0.1" for MyDOS!

Features:

Lists files and directories and lets you simply select what you want
using the arrow keys or a joystick
Quick selection of all 9 drives (press [1]-[9])
Quick selection of files by first-letter (press [A]-[Z])
MyDOS subdirectory support (it even remembers where the selector was when
you "come back out" of a directory)
Atari Peripheral Emulator (APE) "PC Mirror" subdirectory support!
Sort files by name or file extension
Filter the listing by file extension (list only executables "EXE", "COM")
Setup file lets you set screen colors, listing title, sorting mode, and
filter mask for each directory
Built-in 40 column ATASCII text file reader

So with this, you can have a huge (up to 16MB under MyDOS 4.53!) game disk
with lots of subdirectories, and easily navigate through them. You can read
the docs to a program before loading it, without ever leaving "File Selector".
You may even be able to quickly determine which category (subdirectory) you're
in by the screen's color scheme (and of course by the screen's title).

Make this your number-one autorun!

Thanks to Michael Kling for suggestion I write this program.

It will be available at UMICH FTP (atari.archive.umich.edu/8bit) or
e-mail me and I'll send you a UUencoded copy! (Please specify if you'd
like the single ".ARC" or the executable and documents seperately).
(If you don't, I'll assume you want the "ARC" (which, BTW, comes with source))

Have fun!

Oddly, I'd never seen either a 1400 or 1450 until I got my hands on
the 1450 motherboard...now it seem every time I take a road trip I
run into someone else who has one (never yet seen a complete 1450xld out
side of the one Bob Brodie had a Glendale show many years back).

k >I have a 1400XL myself and if I'd use it as my main machine if I could
k >trust someone to give it a RAM upgrade and if I could get the PBI to work
k >right.

I'd love to try the ram upgrade for the 1450 that I downloaded a while
ago...but I think I'll hold off for now. As far as the PBI goes...only
way is to remove the two onboard devices...the R: device is the main
conflict on the MIO and the BB just uses everything in sight!

Had ICD followed the 1090 spec (and you can see that mostly did) the MIO
would have had no problems working on the 14xx series machines. If I
recall from when I was playing with all this, the MIO's R: device conflicts
with the V: device and part of the T: device...

Aww man. It's just fun. It's a typical "old game". Some Players wandering around (as best they can) on strange playfield terrain (compare to say, Super Mario Bros for NES), that bird that takes you randomly anywhere, the strange connections between rooms, the random music at the title, the nasty traps.

It's become one of my favorites. Still can't beat it. I'm sure it has as good an ending <yawn> as you say "Rainbow Walker" does.

I say a game should either have NO ending (Asteroids, Pac Man) or a GOOD ending (Super Mario Bros 2 and MegaMan 2 for NES have neat endings).

:)

Well, I took a break from Lemmings (which was a break from SeaFight (which was a break from MUX stuff)).

Whew. I think I need a break! :)

Anyway... I dug up (as if it was hidden somewhere) the source code to my "MyDOS File Selector" and enhanced it quite a bit!

Here are the NEW features:

Ability to sort directory listings (by name or extension) (SORT addition to FILESEL.DAT command list)
Joystick control (not total - still need keyboard to get out of subdirectories or choose new drives or exit to DOS, of course)
APE PC Mirror Subdirectory support
Built-in page-by-page 40 column text file reader (with joystick control)
FILESEL.DAT setup files are looked for every time you change a directory or drive (not just loaded from D1: when you first start)

Version 0.1 will be up at UMICH, including the executable, the DOCs (hey, try reading them from the program! :)), and the Action! sourcecode.

Have fun!

: What ended up happening to them?
My favorite Synapse games were Fort Apocalypse (albeit too short!),
Drelbs and of course Shamus. It did have an ending. In the final stage
you confronted the 'thing' and shot through a moving hole in the wall
if you were'nt fast it would get you. Then the screen lit up with some
CPU rainbow graphics and that was it.

Synapse developed some kickass business software for Atari, but was
screwed over royally by the Tramiels when they bought the company.
Synapse was in deep financial problems.

Synapse was then bought by Broderbund. William Mataga (author of Zeppelin (yes))
and Shamus (yes yes yes) and another guy made then a apparently not all
that successful "Infocombeater". I got one of the games, (I'd buy anything
made by Mataga:) were you were cruising thru other peoples mind. I think
it was called Mindwheel. I like it a lot.

Yes Synapse games were the best!

If anyone knows, what happpened to Mataga, please lemme know.

Nat!

How about the even rarer Atari 1055 3/.5" disk drive! These were
only made in prototype form with a METAL case, but a few of them "escaped"
from the factory. They were basically a 1050 (single-sided, single and
"enhanced" density) with a 3.5" mechanism.

I think the 1055's are almost as rare as the 1090 expansion cards.

I'm interested in getting a cracked copy of AR:C & AR:D to run w/ an
emulator on a Pc if its not too much trouble.

>Actually, I've had it for years...never had the original (I was a bad boy back then), but I DID buy the original
>(several times) later on in life (a hope for atonement) in addition to the dungeon <g>

I had an 800 and a 1040st ver of AR:C. That was a long time ago and I
sold the 800 & the st's Monitor died..

Thanks

Kevin

4425. .ATR / .XFD file format

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-26 00:00:00 UTC
From: keithyer@IntNet.net
Message-ID: <4bpcc7$oh4@mercury.IntNet.net>
Source record: 86847

Does anyone here know how these files are encoded? I know this much:
The 8-bit stores data using the one's compliment. Ie. in binary 1=0,
0=1. I know that one of these formats is a raw dump, and the other has a
header. (16 or 12 bytes, I believe)-How is that header constructed?

What I'm looking for is this: Does the .ATR/.XFD format (the raw dump)
get converted (one's compliment) or no? Are the sectors written in
"natural" order?

Would some kind and gracious soul be so generous as to mail me dcmtoatr
dsktoatr (I think those are the filenames).

Check the documents to SIO2PC. It has the exact format of the ATR file.
So far as I know, the XFD file is identical except it's missing the useful
16-byte header (ie, the disks size is determined by when the EOF is reached).

Anybody tried out their Black Box with the SCSI version of the Iomega
100Meg ZIP Drive?

If so, were you successful and did it recognize the embedded SCSI option
from the HDFMT.COM file??

Probably 'cause carts like Chase the Chuckwagon can fetch upwards of
$125 in any condition and Vectrex machines generally run upwards of
$100, for example. :-) I got a smile out of it anyway... Hell, I'll
pay *$25* for Vectrex machines... *grin*

> games and/or games with really smart nasties, GET THIS.

It does indeed rule. It's quite a game. I tried to contact the
author about a year ago, by posting inquiries here, CI$ and Delphi, but
to no avail. I'd gladly pay for the complete version.

>
> (2) Does the author still exist - when was this game written? Can I still
> get the registered version (with more enemies, levels and weapons) ??

> transfers to work between BobTerm 1.2 and my Unix host?
>

Had this trouble a couple months back when trying to use my unix account
to get files transferred to my Mac for use with Rainbow. Unfortunately, I
don't recall the *exact* solution. But I did have problems as you describe
when trying to send a single file at a time using xmodem. I know the
solution involved using "Y-modem (Batch)" on Bobterm's end; I forget the
proper accompanying unix syntax ("rx -k *" ?). Anyway, it did finally
work.

2 questions :

Did anyone ever beat Necromancer? (what's the ending like?)

Has anyone gotten Shamus to work with Rainbow? (it's one of the few that
locks up on me)

My copy of Alley Cat has just died on me :(((Does anyone know of a
shop that still has one in stock?

Anyways, another favorite of mine is Necromancer. I'd go as far as to
say that Bill Williams is the best "one-man-show" coder... I wonder
what he is doing nowadays.

Are you using Spartados or Mydos? If you're using TOS, you're in the
wrong newsgroup (go to comp.sys.atari.st).

>so what you are saying is that when i take the file that is perfect on my
>atari, transfer it to my pc using SR, then SR changes it to atascii format?

No, the file is perfect after you transfer it to the PC using SR. The
problem is that the PC and the Atari interpret characters in a slightly
different manner. More specifically, the character the Atari uses to
represent a carraige return happens to look like a 'cents' sign on the PC.
So, what you have to do is run the file through a program that will take
these sorts of differences between the Atari and the PC and make the
appropriate conversions.

Keith Hyer (keithyer@IntNet.net) writes:
> Does anyone here know how these files are encoded? I know this much:
> The 8-bit stores data using the one's compliment. Ie. in binary 1=0,
> 0=1.

It may be stored by the disk drive that way, but it is delivered as
normal readable data to the SIO device. Basically just the data you
want stored sent in sector sized, CRC checked chunks.

> I know that one of these formats is a raw dump, and the other has a
> header. (16 or 12 bytes, I believe)-How is that header constructed?

The .XFD format has no identifier or format data, its just a raw blob of
sectors. The .ATR format does have a 16 byte header that in a rather
bizzare way describes the size for the disk. Its documented in the
SIO2PC.ZIP archive.

The .PRO images Ive designed use much more extensive tagging information,
and I may make the specs for it public in the next release of APE.

> What I'm looking for is this: Does the .ATR/.XFD format (the raw dump)
> get converted (one's compliment) or no?

No, the .ATR and .XFD format store data as it is delivered to the SIO devices,
in its 'natural' 8 bit form.

> Are the sectors written in "natural" order?

Depends on what you mean by this. In .XFD and .ATR files they are stored
sequentially 1-720 (or higher). The .PRO format allows for the sectors
to be stored pretty much anywhere in the image.

> Would some kind and gracious soul be so generous as to mail me dcmtoatr
> dsktoatr (I think those are the filenames).

APE (http://www.nacs.net/~classics) has a built in DCM->ATR converter, but
the other tools are available by gopher @ gopher://gopherblue.umich.edu
in the Software Archives/Atari/8Bit section.

Steve

*** Area: COMP.SYS.ATARI.8BIT Date: 2 Nov 95 2:49:53
*** From: "ernest.r.schreurs"
*** To : All
*** Subj: 2000 ATR PD/Shareware images for use w

From: "Ernest.R.Schreurs" <ernest@pi.net>

We are happy to announce the availability of the "POOLDISK" CD-rom
for the Atari XL/XE computer. This CD contains the contents of
over 2000 diskettes. Everything is stored in the ATR format as used
by SIO2PC and APE. This is also compatible with the format used by
the Xformer. There are some 250 Megabytes of ATR images on the CD.
To accomodate the Atari ST users, all images are also stored in the
XFD format as used by the ST-Xformer. This occupies another 250 Mb.
These disks include over 250 diskettes from ABBUC, and over 330 from
the BELLCOM PD library. There are also lots of disks from usergroups,
magazines and disk magazines. The Umich.edu 8-bit archive has also
been converted to the ATR format and is now stored in over 500 disk
image files. There are also some files not in ATR format on the disk,
for those that want to try and write an ISO-9660 driver for the XL/XE.
Until someone manages that, you need a PC or an Atari ST to act as
a server for your Classic Atari, or one of the emulators. The
remaining 100 meg of the CD is filled with 165 pictures from various
Atari 8-bit systems and peripherals. This CD is now available from us
for US $ 35, which includes shipping by the cheapest possible rate,
which may take over two weeks. Send a check drawn on an US bank to:
Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands
Make checks payable to Ernest R. Schreurs. Do not fotget to mention

the mailing address, so we know where to send the CD to.
If you cannot send a check, US $ 35 in cash is acceptable too, but then
it is your own risk. If the money does not arrive, we will not know
that you sent any. If the check or the money gets here, we will ship
the CD as soon as possible. A few notes: some of the disks are in
German, Polish or Dutch. As far as we know, everything on the disk is
Public Domain or Shareware, except for the Pokey Magazines and the
Mega-Magazines, which are on the CD by permission, and are restricted
from further copying. You are responsible for whatever is copied off
the CD, if we accidentally placed anything on the CD that is not PD.
If the Jewel box cracks during shipping, this is your own risk. After
all, a new one costs under $1.
If you have any questions, send an E-mail to ernest@pi.net

END of message...

I hope this will help you....

>header. (16 or 12 bytes, I believe)-How is that header constructed?

One's compliment is at the MFM encoding level, ATR has a 16-byte header.

>What I'm looking for is this: Does the .ATR/.XFD format (the raw dump)
>get converted (one's compliment) or no? Are the sectors written in
>"natural" order?

Nothing is encoded in MFM format, they are at the natural binary format,
decoded as you would see them via a sector editor.

>Would some kind and gracious soul be so generous as to mail me dcmtoatr
>dsktoatr (I think those are the filenames).

DSKTOATR, afaik, does not have the source code available. But DCMTOATR,
since it is available for Unix, Mac, and the PC, does have the source
code available, you can ftp from ftp.gate.net and look in
/pub/users/cmwagner/dcmtoatr and you will find the source code to dcmtoatr
and other utilities, another place to hunt is Preston Crow's ftp site,
ftp.cs.dartmouth.edu and look in /pub/crow/atari, there you will find
the latest versions to binload and atr2unix (both for PC and Unix), and you
should also find those two on my ftp site.

If you have any question drop me a line, I will try and help.

Arguing about whether or not copying old Atari software,
especially from companies that no longer exist, is complete and
utter CRAP!

When you can buy a CD/Tape with all of Mozarts songs on them,
and anybody can produce a CD with practically any Bach, Mozart,
etc... They're DEAD. They got to be as appreciated in life for
their music as they could possibly be.

Same with old Atari software. The original companies either no
longer exist (Datasoft), or are completely in different markets
now anyway (Electronic Arts, Atari)... Hopefully, Philip Price
(whom I worship the bytes and ground that man walked on) got his
due from AR:The City and AR:The Dungeon. It's unfortunate that
no more were ever produced, and it's strange how so many of us
played AR years ago, but still love that old game today. I
highly doubt there is suddenly going to become a HUGE
underground market for Pirated Copies of AR, and most of us who
DO own a legitimate copy wouldn't be able to get it running with
XFormer on our monster PCs unless we actually HAD a "cracked"
copy of AR in the first place.

(I wouldn't even know where to start trying to get it from my
original disks to my 486 anyway.)

At any rate, Philip Price, who has been seen around this
newsgroups, probably still swells with pride at all the people
who did play AR, and loved AR years ago.. and still do today.
(Especially considering that electronic games pre '86 or so were
suffering from the coorporate "We will have no programmers names
mentioned with this game" idea. It was neat to be able to see
who the game could most be attributed to. :)

So, if anybody did have a working copy of AR that would work on
XFormer, I'd like to be able to run it myself. (The IBM version
of AR just doesn't do AR justice..) (Or Rainbow, or whatever.)
(Old Atari died a horrible death, BTW..)

Dep

4454. A message to OS/DOSdevelopers

Newsgroup: comp.sys.atari.8bit
Date: 1995-12-28 00:00:00 UTC
From: CONRADUS@plearn.edu.pl
Message-ID: <951227.183659.CET.CONRADUS@PLEARN.EDU.PL>
Source record: 86776

A message to Operating Systems/Disk Operating Systems developers.

Dear developer!

We are pleased to present you a preliminary document about our IDE hard drive interface for Atari 130XE (and compatible) computers. As existing Disk Operating Systems aren't able to use all the capabilities we provided, we are kindly asking you to upgrade the latest versions of your work and implement the specific IDE features, those have been described below. The four general problems we found trying to use any of the existing DOSes, are as follows:

1) All DOSes we tested, i.e. SpartaDOS 3.2g, SpartaDOS X 4.20, MyDOS 4.53 and BWDOS 1.10, when they have been executed, seem to force the DUNIT (0301) value to 01. Such action is not necessary, because the DUNIT is already set by the XL OS's RESET routines, and is obnoxious, because, as a result, the DOS is unable to read its config files, when the system has been started from a partition other, than D1:.
2) All the DOSes we tested are unable to read/write 512-byte sectors, so they are unable to work in the IDE native mode (see below). The interface provides the emulation mode to handle 256-byte sector operations, but, as a result, the drive is unable to reach its full speed. Especially any writes to the hard drive are very slow. The implementation of the 512 byte allocation units may also be profitable in the future, if we decide to add support for DMA transfers.
3) All the DOSes we tested are unable to handle big partitions (i.e. over 16 MB limit). The implementation of the 512 byte allocation units may solve this problem in a part (the limit would be 32 MB per partition then), but, if you decide to implement big partitions handling, we advise you to consider about using the 23-bit sector addressing in conjuntion with the larger allocation units (see below for details).
4) All the DOSes we tested are unable to handle disks D10-D15.

Operating Systems developers please note, that there is no necessity to set the DUNIT value in the OS BOOT routine, as the DUNIT is already set by previous RESET routines.

We hope, that you will take these problems into consideration, decide to support the features described below and don't hesitate to send us your comments, if any.

I. Introduction

Seven years ago, when I first heard about hard drives for the Atari 8-bit, a 20 MB SCSI device's price was over 600 USD and, of course, was out of reach for people in a country on the wrong side of the Iron Courtain, where wages were about 20 USD per month. The 1050 floppy drive was a dream - what would I say about the hard one...?

Over the next six years many things have been changed. Among others, the Iron Courtain got rusty, we have started earning more money, got some new Atari computers and, simultaneously, the prices of hard drives have gone down dramatically... and one day I realised, that it is possible to obtain an IDE hard drive for the beloved 8-bit Atari with very reasonable price! But there still was no documentation and the only one, that I knew, was a

theory about writing 'new device' handlers for the XL operating system...

The most important thing on my "way to the hard drive" has happened, when a friend of mine has found a "Technical Reference Manual" for a Caviar WDAC2200. I read this paper very carefully, then went to Jack - a person, who looks to know everything about wires and other strange gadgets, those have been fixed inside and seem to make it work. About a week later Jack said, that there was no objections (contraindications, as we used to say) to build an interface - so the project started.

The last year we spent thinking, talking, building the hardware (Jack), writing the software (me), testing, fixing bugs, catching incompatibilities, and learning, learning, learning. We have discovered a lot of strange things about Ataris and IDE hard drives (some of them have been mentioned below). Finally, we are pleased to present you our results - we tried to make them as professional, as it have been allowed by the limited (2k) ROM space, not very "elastic" operating system and not very great processing power of the Atari 8-bit computer. I hope you will agree, that we did a good job.

II. Capabilities overview

The Interface's internal software provides two modes: native and emulation. The native mode uses a 512 byte physical block as a logical data sector, the emulation mode uses the physical block to store two 256 byte logical data sectors. ALL existing DOSes require the emulation mode to work properly.

Maximum drive capacity: 8388607 physical blocks on each device.
Maximum number of partitions: 15
Maximum capacity of a partition: 8388607 logical sectors
Logical sector length: 256 or 512 bytes (larger blocks will be implemented in the future)
Average speed: 58 kilobytes per second (native mode, R/W)
32 kilobytes per second (emulation mode, reading)
7 kilobytes per second (emulation mode, writing)
Booting from any partition
Write protection capability
8 jumpers to set the device number for the operating system

Note, that ALL existing DOSes limit the partition size to 16 MB.

III. How to make it work (step by step)

1) Make sure, that the power on your computer is turned off.
2) Insert the interface to the connector at the back side of the computer.
3) Connect the interface and a 3,5" IDE drive with the cable. Caution: You may damage the drive if the interface cable is not connected properly. Make sure, that pin 1 on the cable (red line)

is connected to pin 1 on the drive and on the interface (red dot).
4) Connect the power supply and the drive.
5) Insert the utilities disk into drive 1.
6) Turn on the power on the hard drive and on the computer holding down the SHIFT key. Make sure, if the drive is spinning up properly. If not, turn the power off, check the connections and try again. Note, that some very old drives need A LOT of power, so our power supply may not be sufficient.
7) Be patient - the Interface waits some seconds when the drive is spinning up.
8) When the MyDOS is ready to use, execute the FDISK.COM file.
9) A menu should appear. If you see a message like "Device not found" instead, please turn the power off, check the connection between the interface and the computer, then try again. Check the jumper position.
10) Select the "Surface test" from the main menu. Your drive will be tested for bad sectors. If the test finishes without any message, the drive is in good condition - no bad sectors have been found.
11) Select the "Partitioning" from the main menu. "Total" will indicate you total amount of 512 byte sectors, that have been found on the drive, "Remain" - total amount of sectors, that haven't been allocated yet, "Specs" will show a number of cylinders, heads and sectors per track.
12) Use arrows to select a drive you want to be a partition.
13) Press the RETURN key and type in a number of sectors, that you want to be allocated to the partition. Note, that it is a number of real, 512 byte sectors, so if you specify 32767, the DOS partition will have 65534 logical, 256-byte sectors.
14) Press RETURN to confirm the number of sectors or press ESC key to cancel.
15) If you want to have more partitions, repeat the last three steps as many as you want.
16) Press the TAB key and select a partition, that you want to be the BOOT partition. If you are the SpartaDOS X user and you want to have the CONFIG.SYS on the hard drive, the BOOT partition must be D1:, so you should change the physical number of your floppy drive to D2: or another.
17) Press RETURN key to set the BOOT partition.
18) Press the TAB key to move the cursor to the menu at the bottom right corner of the screen.
19) Select the "Opts" option.
20) Select the boot type according to your system configuration:
- "control", if you want to boot up MyDOS (or another DOS) from other partition than D1: The interface will take full control over the boot process.
- "pass", if you want to boot up MyDOS (or another DOS) from D1: The interface will pass the control over the boot process to the operating system. Select this option, if you have any troubles

with the "controlled" boot up - the interface, taking the control over the boot process, uses some hints that may not work with some DOSes, cartridges or upgraded (customized) operating systems. You MUST select this option, if you are the SpartaDOS X user.
21) Press ESC to exit the "Options" menu
22) Select the "Write" option to write the new partition table to the drive.
23) Press ESC to return to the main menu
24) Select the "Soft format" option from the menu. The FDISK will attempt to build new directories on the attached partitions. Note, that the SpartaDOS 3.2 does not provide such action - to do it, you must use a separated formatter, as the P_FORMAT.COM.
25) Exit the FDISK.
26) Write the DOS file(s) to the BOOT partition. If you are the MyDOS user, select the "H" option from the DUP menu. If you are the SpartaDOS 3.2 user, copy the DOS to the BOOT partition and use the BOOT command to make the disk bootable.
27) Press SELECT/RESET to cause the cold boot. The DOS will load itself from the drive - the installation process is completed.

Some IDE drives used to clear the BUSY and assert the READY bits in their internal status registers *before* the spin-up process is finished - the drive looks to be ready, but isn't ready in fact and cannot execute any commands (very strange, by the way...). To prevent such troubles during power up, the internal software waits about 5 seconds before taking any action with the IDE controller. This delay is not necessary during the cold boot, that has been caused by pressing SELECT/RESET or via OS entry RESETCD (�E477). In such case the internal software uses a fast initialization method. However, if you turn the power switch off and on very quickly, the initial routines may not recognize this boot process as a real power up. As a result, the boot process will crash. To prevent such problems, after turning the power off, you should always wait 10-15 seconds before turning it on again. This time should be sufficient to invalidate internal flags, that have been located in RAM.

IV. Keystrokes

SHIFT/RESET disables the drive. The drive will remain spinning, but the partitions will not respond to operating system requests (error 138). To enable it again just press the RESET key. SELECT/RESET forces the cold boot.

V. Write-protection feature

The IDE hard drive interface provides the write-protection feature to minimize a risk of accidental data damage caused by viruses, damaged software or children. When a partition is locked, there's NO POSSIBILITY to write data to this partition or

unlock it by asserting commands, causing a cold boot or turning the power off and on. Damaging a write-protected partition by writing accidental data to random memory locations is also *practically* impossible - the risk is very small.

VI. Executing non-DOS software with the hard drive

Some software, especially games and demos, have their own disk formats and cannot be copied to a partition. However, the IDE software provides limited capabilities to execute such programs.

If you selected the "controlled" hard drive boot when partitioning the drive and your BOOT partition is not the D1:, you may run the non-DOS disk from the floppy drive. To do it, insert the disk into the floppy disk drive then press SELECT and RESET keys holding down the SHIFT key. The internal software of the IDE Interface will pass its initialization routines and your computer will boot up from the floppy. The hard drive will be "invisible" for the system.

If you want to execute such software from the hard drive, you must provide a small partition to use it in such manner. Though the D10-D15 partitions are invisible for existing operating systems and cannot be accessed by DOS, they may be booted as well. When you are partitioning your drive, create a small (up to 520 physical blocks) disk, for example D10:. When you complete the installation and make the drive work, execute the FHCOPY.COM file from the utilities disk, then copy your floppy to the D10:. Now execute the FDISK, select the "Partitioning" option from the main menu, then press the TAB key twice to move the cursor to the menu at the bottom right corner of the screen. Select the "Opts" option, then set the "Drive redirection" to D10:. If the "controlled" boot-up has been selected, you must change it now to the "pass" mode. Write new partition table, exit the FDISK and reboot the system - the non-DOS program will load itself from the hard drive. To return to the previous configuration, insert the utilities disk to your floppy disk drive, reboot the system holding down the SHIFT key, then execute the FDISK, reset the "Drive redirection" to D1: and "Boot type" to its previous state, write the new partition table, exit the FDISK and reboot the system.

VII. Dual drive configuration

The IDE drive interface is able to handle two IDE devices configured as master and slave drives (please refer the drive manual to connect it and set up properly). However, some drives, when they are configured to work as the slave device, used to wait some seconds before they start spinning. For this reason, the Interface DOES NOT INITIALIZE the slave drive during power up or reset. It would make little sense, because the drive is not spinning (i.e. is not ready) at that time. As a result, the slave

drive remains not initialized, even if the boot process has been finished and the system looks to be ready to use.

If the slave drive have finished the spin-up process, there are two ways to make it work properly:
1) assert the ALL RESET command (see next section), or
2) force the system to read a sector from any partition, that have been allocated to the slave drive - if the drive is ready, it will be recalibrated automatically.

Please DO NOT start the operating system from the slave drive partitions.

VIII. Software development information

The IDE drive partitions operate as normal floppy drives or ramdisks and can be accessed via OS DISKINT (�E453) and SIOINT (�E459) routines. All the partitions recognize the following commands:

1) Standard subset

R - read a sector - this command reads a specified logical sector from a specified partition. It reads ALWAYS THE WHOLE LOGICAL SECTOR, i.e. 256 or 512 bytes, according to the current mode and regardless of the DBYT value. The sector number is a 24-bit value, the most significant byte (now called DAUX3) is located at �0307 (this byte was unused by the XL OS). Sector numbers less than �000001 or greater than maximum sector number for the specified partition are invalid and will cause the error 144.

P - put a sector - writes data to a specified logical sector on a specified partition. There are the same restrictions, as mentioned above. This command will return status 144 when attempting to execute on a write-protected partition.

W - write a sector - the same, as "P" command.

S - read status block - transfers the 4-byte disk status to the memory. The bit of the first byte are as follows:
7 - not used by the hard drive
6 - write protection enabled
5 - double density drive (always 1)
4 - master present (usually 1)
3 - slave present
2 - not used by the hard drive
1 - not used by the hard drive
0 - not used be the hard drive
The second byte provides reversed (eor'ed with �FF) value of the IDE controller error register. The bits are as follows:
7 - BBD - Bad block detected
6 - ECC - Error correction code (uncorrectable error)

5 - NUL - unused, always 1
4 - IDNF - ID not found (target sector could not be found)
3 - NUL - unused, always 1
2 - AC - Aborted command
1 - TK0 - Track 0 error (unable to find a valid track 0)
0 - DAMNF - Data address mark not found
The normal (default) value of this byte is $FF. The next byte has a dummy value $E0. The last byte of the status block holds the number of retries for the software IDE handler in ROM.

N - read configuration - reads the 12-byte PERCOM block to the memory. The values returned by a partition are as follows:
0 - number of tracks (always 1)
1 - revision number ($10 = 1.0)
2 - total number of logical sectors, the middle byte
3 - total number of logical sectors, the low byte
4 - total number of logical sectors, the high byte
5 - additional information:
bit 3 - IDE hard drive partition (always 1)
bit 2 - double density drive (always 1)
bit 1 - 8 inch floppy disk drive (always 0)
6 - number of bytes per logical sector, high byte
7 - number of bytes per logical sector, low byte
8 - unused, always $FF
9 - value $49
10 - value $44
11 - value $45
The last three bytes contain an identifier of the hard drive type ("IDE").

2) Specific ones

$E6 - sleep drive - stops the drives and deactivates their internal controllers. See ALL RESET command for the DCB variables details.

$E7 - all reset - resets, recalibrates and reinitializes both hard drives. It is the only way to exit the Sleep mode. This command needs the number of any partition stored to the DUNIT ($0301). The master drive must be present while asserting this command, otherwise the timeout error will occur.

$EC - identify drive - transfers the 512 bytes of data, that specify the drive's parameters. The fields are as follows (F = fixed value, V = variable, R = reserved, should be zero):
0 - vendor specific information, bits are as follows:
15 - 0, reserved for non-magnetic devices (F)
14 - vendor specific (F)
13 - vendor specific (F)
12 - vendor specific (F)
11 - vendor specific (F)

10 - vendor specific (F)
9 - vendor specific (F)
8 - vendor specific (F)
7 - removable media device, if 1 (F)
6 - removable controller and/or device, if 1 (F)
5 - vendor specific (F)
4 - vendor specific (F)
3 - vendor specific (F)
2 - vendor specific (F)
1 - vendor specific (F)
0 - reserved (R)
2 - number of cylinders (F)
4 - reserved (R)
6 - number of heads (F)
8 - vendor specific
10 - vendor specific
12 - number of sectors per track (F)
14 - vendor specific
16 - vendor specific
18 - vendor specific
20-39 - serial number, ASCII characters (F)
40 - vendor specific
42 - vendor specific
44 - number of ECC bytes transferred on LONG operations (F)
46-53 - firmware revision, ASCII characters (F)
54-93 - controller model number, ASCII characters (F)
94 - numbers of sectors/interrupt R/W multiples, bits:
15-8 - vendor specific
7-0 - $00 = READ/WRITE MULTIPLE not implemented (F)
$01-$FF = maximum number of sectors that can be
transferred per interrupt on READ/WRITE MULTIPLE commands (F).
96 - reserved (R)
98 - capabilities, bits:
15 - reserved (R)
14 - reserved (R)
13 - 1 = standard standby timer values are supported
0 = standby timer values are vendor specific (F)
12 - reserved (R)
11 - 1 = IORDY supported (F)
0 = IORDY may be supported (F)
10 - 1 = IORDY can be disabled (F)
9 - 1 = LBA supported (F)
8 - 1 = DMA supported (F)
7-0 - vendor specific (F)
100 - reserved (R)
102 - PIO data transfer cycle timing (F)
104 - DMA data transfer cycle timing (F)
106-511 - reserved
All values are in standard low/high convention. Some parameters

are defined as a string of ASCII characters. For the string "Copyright", the character "C" is the first byte, "o" is the second byte etc. When such fields are transferred, the order of transmission is:
- the 1st character ("C") is on bits 15 through 8 of the 1st word
- the 2nd character ("o") is on bits 7 through 0 of the 1st word
- the 3rd character ("p") is on bits 15 through 8 of the 2nd word
- the 4th character ("y") is on bits 7 through 0 of the 2nd word
etc.
Note, that the DMA transfers, although may be supported by the drive itself, may not be supported by the current version of the interface's hardware. Please also refer the SLEEP DRIVE command to get an information about the DCB variables.

$EE - force media change - forces the interface to re-read the partition table from the drive.

All other commands will cause error 139 (negative acknowledge). Note, that the software does not provide a FORMAT DISK command - it hasn't been implemented to prevent an accidental data damage. The drive must be formatted using a separated program.

Operating system developers should note, that the internal software of the IDE Interface changes the DUNIT ($0301) to the BOOT partition number during boot up.

IX. Memory usage

The Interface's internal software uses the following RAM locations: $01 and $34-$3C. The PDVMSK ($0247), PDVRS ($0248) and DCB variables (especially DAUX3 $0307) should be used only in their proper functions (please DO NOT use them as temporary data registers!). The $0400-$06FF area should also remain intact during the cold boot.

X. Error messages

You can get the following error reports from the IDE drive:

138 - Timeout error - attempting to read or write data to a partition, that is physically allocated to the slave drive, while the slave drive is busy, not ready or does not exist at all; or attempting to assert the ALL RESET command, while the master drive is not present. It may occur, if you accidentally disconnect the master drive or disconnect the slave drive without reconfiguring your system. It may also indicate a damaged partition table - please reboot your system. If this action doesn't cause any effect, you must use the FDISK to repair the partition table. See also section VII. - "Dual drive configuration".

139 - Invalid command

144 - Device done error:
1) the software attempted to write data to a write-protected
partition.
2) the software attempted to read or write data outside of the
limits, those are valid for the partition.
3) there is a bad sector on the partition. Please assert the "S"
command to get the value of the internal IDE error register.
4) the interface's software is unable to handle your drive.
Please run the FDISK and select the "Surface test" from the main
menu. If the test fails and you know, that your drive is in good
condition (no bad blocks) for sure, please assert the IDENTIFY
DRIVE command (from a BASIC, for example), copy the buffer to a
file and send the file to us.

Anyone know anything about the game "Pondering About Max's"? I seem to remember some ads for it in Antic, but I'm not quite sure.

Is it good? Is it smelly? Thanks!

I'm selling the following Atari items. POSTAGE IS EXTRA. In a lot of cases the postage will probably exceed the cost of any hardware purchased.

IMPORTANT - Everything is sold "as is". Any known defects are listed.

ATARI HARDWARE - All hardware items include all of the neccesary items needed to hook it up (Cables, power packs, etc.) unless otherwise noted.

ATARI 130XE Computer $15
ATARI 1027 printer $5 defective - 1st 40 columns print normal 2nd 40 columns are scrambled.
ATARI 1020 Color Printer $10 - missing manual, needs new color pens. You may still be able to get the pens from Radio Shack as their color printer uses the same pens.
ATARI 400 with 32K no power pack or accessories. $3
It should still work, but there is no way for me to test it.
ATARI 800XL defective $3
Has power pack, but is missing other accesories. Screen turns green when it is turned on.
ATARI 800XL defective $4
Same as above, but it has all the accesories.
ATARI 810 Disk Drive defective $10
Drive doesn't work. It spins but doesn't read.
ATARI 520ST defective $20
Computer boots up, but can't communicate with the disk drive. I don't know if the problem is with the drive or the electronics in between. Also, missing power pack.

MPP-1150 Parallel Printer Interface $5
Connects Atari 400, 800, 600XL & 800 XL to a parallel printer using the 36-pin Centronics standard. It also worked with my 130XE.

ATARI ST SOFTWARE - All software includes the original packaging and runs on the 520ST.
$4 each or $3 each if you buy 7 or more.

Dungeon Master
Dungeon Master Chaos Strikes Back
Time Bandit
Shadowgate
Bard's Tale 1
Arctic Fox
Paladin
Day of the Viper
BoulderDash Construction Kit
Moebius

Night Hunter
Bubble Ghost
Shanghai
Puffy's Saga
Populous
Bloodwych
Questron II
Demon's Winter
Phantasie III: THe Wrath of Nikademus
AD&D Hillsfar
AD&D Heroes of the Lance

GFA BASIC 3.0 $5

PUBLIC DOMAIN ST SOFTWARE - Approximately 30 disks of PD software, mostly
from Bre Software and Accusoft. $10 for all

MAGAZINES: 50c each
ST LOG
1988 May Jun Jul Aug Sep Oct Nov Dec
1989 Jan Feb Mar Apr May Jun Jul Aug Sep
ANALOG - Each issue includes a 32(?)-page ST LOG pullout magazine.
1986 Apr May Jun Jul Aug Sep Oct Nov Dec
START
1989 Sep Dec
1990 Mar Apr May Jun Dec
1991 Jan Feb Apr
ATARI INTERFACE Aug 1990, Feb, Mar, Jul 1991
ATARI EXPLORER Jul 1992
ST X-PRESS Oct 1989
ST FORMAT (British) Nov 1993

ATARI 8-Bit software - $10 for all of the following.
Ballblazer, Lords of Conquest, Gauntlet, Micro League Baseball, Galaxian
cartridge (no box or manual)

Message-ID: <9512290104591.DLITE.bjcorr@delphi.com>
Source record: 86784

And on the heels of Konrad's post about his IDE interface project...

Well I promised to keep people advised about the internal IDE drive project of Bob Wooley's that I have been playing with, so....
I built his interface and got it running with a little 2.5" Toshiba 42meg drive. I then mounted the drive and interface inside the 1200XL case and followed Bob's instructions on how to hook up a beefier power supply (Bob ended up mounting an ST supply for me.) The whole rig worked fine, but we needed a safe place to put the IDE code so it wouldn't get stepped on. Bob has a hack for putting D6xx-D7xx into ram, so it got put there. It worked, but the code still got hosed and more work on the code was needed. That was the state of things last time I piped up.
I just got the 1200 back from Bob with a new twist. In addition to the original 800XL OS ROM that had been mounted at the beggining of this project, there is now a smart socket with 32k of SRAM in there that will hold another OS. Writing to the SRAM can be disabled/enabled with a switch and you can boot from it or the ROM with a flick of a second switch. The SRAM now holds a modified os (just the IDE code added to D6xx-D7xx, a JSR $D600 inserted at $C95B to point to the IDE code and a byte reserved at $FCB8 for the head selection) and works fine. I even hosed the SRAM once already and restored the modified OS easily. OS mods are now a snap. There are preconfigured partitions for the drive in the IDE code area that can be selected easily and even reconfigured to any size you wish (within DOS limitations!) It runs with all the 2.0 variants (I use MyDos) so far, Bob said he will work on Sparta. You can select any one of the first 4 partitions to be drive 1 with a control-F2 keystoke, the current drive selected being reflected in the L1 and L2 LED's, the Power light will double as a HD access light (still working on this one.) Bob hopes to eliminate all switches in the next prototype and make all OS switching, write enabling/disabling selectable by software. This will allow loading a new OS from disk a 1 step process.
In the next (or current!) issue of AC Bob goes through the installation of the smart socket and SRAM and I beleive will eventually outline this whole project, so those interested, get that subscription to AC in the mail! I am having a blast with this toy! from power on to the MyDos screen completly painted, 7 seconds. Oh, and we tried it with a sweet-16 installed, no problemn. Now, add 512k of SRAM memory for the sweet-16 and.....wow!

Message-ID: <30E3D942.5713@fcsmpt.mum.edu>
Source record: 86788

The Twin Galaxies Intergalactic Scoreboard is "the Official Scoreboard for the World of Videogame and Pinball Playing."

Since 1982, Twin Galaxies has been compiling scores and organizing contests which have appeared on national shows like ABC-TV's "That's Incredible" and "Entertainment Tonight."

Twin Galaxies' high-score charts were carried by the Guinness Book of World Records in the 1984, 1985, and 1986 editions.

During each of many years since 1982, Twin Galaxies has hosted two major contests: "The Videogame Masters Tournament" is a high-score contest on hundreds of current and classic games; The "North American Videogame Challenge" is an invitation only "player-of-the-year" contest featuring competition between hand-picked players. To be considered as a contestant you must register your scores with Twin Galaxies.

Many magazines, newspapers and news services regularly ask for our high-score charts in order to publish the top scores achieved on today's hottest games. To be included in these top score lists you must register your scores with Twin Galaxies.

To submit your scores on arcade or homegames, fill out the following information and send to:
Twin Galaxies
P.O. Box 1556
Fairfield, Iowa 52556
(515) 472-3882

Player Information: Name, address, birthdate, today's date

Game Information: Name of Game, Name of Arcade, (except if homegame)

e-mail address

All score submissions must include photograph of final screen showing score. Three witnesses must sign the submission verifying that they saw you achieve the score. Also, the attendant of the arcade location must sign, too. These four signatures are imperative for the score to be accepted.

Our Twin Galaxies Web site is now under construction! It will enable you to obtain up-to-date high score charts for any game. Be sure to send us your e-mail address so that we may notify you when the site is up and running! E-mail to walter_day@fcsmtp.mum.edu.

If you would like to be a correspondent for the scoreboard and function as an official witness for high-score attempts in your area, contact Walter Day at Twin Galaxies (515) 472-3882.

Hello ya'll!!

My Name is Robert Cortese (b4 u ask yes rick is related,, he's
my poppa) ;) Anyways It's been awhile since i've ventured into the atari
world but i still LIKE IT! Also I work for a wholesale distributor so if
anyone ever needs like memory or a cpu or a genuine intel motherboard just
tell me and I'll get it for for no problem. So tell me whats new and
exciting in the atari world?? I heard there was supposed to be a 16 bit
atari called the mars board that never came out, a program called xformer
for emulating a atari on a ibm, and sio to pc. Thats what I know is new
so far, anything I left out???

RC

But you forget, Mozart died in 1791, and by my math, that's over two
hundred years ago. Now, I don't think there will be anyone around that
will care if you pirate Atari 8-bit stuff in 2185! :-) So even under
today's copyright laws, it is not illegal to copy the actual music.
The performances on CD, I'm pretty sure, are copyrighted works of the
performers, so it would not be legal to copy them. Anyway, almost all
Atari software is still copyrighted, since even if the company is
dissolved, the copyright reverts to the author, where it will last
until 50 (75?) years after their death.

Anyway, the easiest way to solve this is by having all the current
companies that sell Atari software to also sell a version, if
available, that will run on all the different emulators.

Why is the Pool CD mostly in ATR format?!? I thought it would be "BBS ready" CD-ROM for use on a BBS so 8bit users can use the disk. FORCING 8bit users to need an ST or IBM to decode the software is rather asinine and short-sighted. I thought it was going to be files on it that were ready to use, but alas, the creators have lost sight about what the CD-ROM should have been about. Our club was planning on ordering it, but I now have urged them to forget it. It isn't worth our time. It's truly a sad day.

The last I looked, Atari 8-bits can use DCM and ARCed files. So far, there isn't any ATR conversion that my 8-bit can do, thus making the Pool CD totally useless to a large portion of Atari 8-bit users. And I thought this was comp.sys.atari.8bit, but it's turning into comp.sys.atari8.atr

Sad.

I am willing to bet there was tons of free space on that CD, as well, so
they could and should have included the original binaries or DCM files.

The only problem with an ATR conversion program for the 8-bit is that you
would need a disk drive that can always hold MORE than what the ATR is,
so for a 90K ATR you need a 1050, for a 130K ATR you need a DD drive... etc

I was starting work on an ATR to DCM encoder for the PC/Unix machines, but
I never got to work on the encoding engine.

I have a inherited many boxes worth of Atari hardware, software, and manuals. There are far too much software (disks and catridges) to list, but here is the hardware. Make offers. Take a bunch (all?) of it, and I'll give it to you dirt cheap!

E-mail is preferred.

Qty Description
---
3 Disk Drive 810
1 Disk Drive: Percom Data w/ PS
4 Disk Drive: 1050
10 Power Supplies for disk drives, dattasettes, and Atari 800's
2 TV/Game Switch boxes
17 Data cables
3 Parallel printer interface
2 Video to TV converters
2 Video to monitor cables
2 RCA cables for TV
1 16k memory module for 800
3 Datasette 1010
2 Computer power supplies
4 Atari 800 computers
2 Daisywheel printer 1027
1 Atari 800XL computer
3 Atari 850 serial interface
1 Atari 600XL computer
2 Atari 1200XL computer
2 Atari 410 datasettes with p/s and data cable
1 Modem 1030 w/ p/s
2 Hayes smartmodem power supplies (no modem though)

1 Indus GT disk drive

1 Atari 1040ST complete system (computer, disk drive, mouse, MONITOR, cables, and software.)

And then there are mounds of disks, catridges, and manuals. Most is for the 8bit systems, but there is a box full of Atari ST software too.

(Wes wants to repair an MIO.)
Wes, somebody here once said FTE has a box full of MIOs that need repair. I think the point was that the MIO is hard to repair. Perhaps also the parts are hard to get. What I'm saying is that I'm not sure, but I think not even the owner of MIO repairs them, could be wrong. Or, put another way, the cost of repair of MIOs is prohibitive, ie. get a MIO II or BB. Both of mine work. I did send one to ICD once and all my problem turned out to be was the 50 pin ribbon had come undone at some points. As far as just the top of the case..... Maybe Mike at FTE would sell you one if he has a bunch of complete MIOs just sorta sitting around.

Back when I originally had my 2600 (80-82), I had the BASIC
Programming cart. I convinced my mom to buy it for me, telling her I
could "write my own games." I really thought I could.
Ha!
The graphics screen was about 10x5, it was terrible!
Later, when I got the Atari 400 and wrote my first real game in
BASIC, I was having a problem. I called Atari's customer service line
(the one where you could get those nifty pamplets sent to you that
explained PMG, character sets, and other subjects) and asked them about
it. It was a graphics-related problem. The woman asked which cartridge
I was using. I told her I was using "The BASIC programming cartridge." The
woman I spoke to said she would have "the programmer" call me. I said OK,
gave her my number, and waited.
The next morning, around 7 AM, the phone rang. I was asleep, so
my dad answered. He woke me up, and told me someone from Atari was on
the phone. I went out to the family room, picked up the receiver, and
spoke to the guy. I explained the problem to him, which was that the
screen was flickering really badly during the game I had made. He asked
what type of game it was. I told him it was a game where you are being
chased by little dot on the screen, and you have to avoid being caught
while traversing ten "rooms," each of which took up a whole screen. He
said, "Well, that's a pretty limited cartridge. It wasn't meant to do
that sort of thing." I said something like, "Huh...?" What did he mean
the BASIC cart wasn't "meant for that?"
Eventually it dawned on me that he thought I was talking about
the 2600 BASIC Progamming cart. I then clarified that I was using an
Atari 400 computer with the BASIC programming language cart. He then
asked how many "Players" I was using. I didn't know what he meant. So,
he said he would send me some information that would help me out.
About a week later, I got a large envelope from Atari. It had
five different packets in it, each one about really neat programming
stuff (or so it struck me at the time) - PMG, character sets, etc.
Of course, none of this helped me at the time. See, not only was
there a misunderstanding about which Atari product I was using, the
nature of the problem was also misunderstood. I, being a beginning
programmer, had written the program somewhat like this:

```
10 X=10:Y=15:A=20:B=15
20 GRAPHICS 3
30 COLOR 1:PLOT X,Y:COLOR 2:PLOT A,B
40 [READ STICK, CHANGE VARIABLES, MOVE BAD GUY APPROPRIATELY]
...
50 GOTO 20
```

Now, the error is obvious, right? :) But at the time, I thought
that computers were much less capable than they are - I thought I had to
tell it which graphics mode to use every time I wanted to PLOT
something. So, the flickering was caused me essentially telling the
computer to set up the display list and clear screen memory every time
through the loop!
Thankfully, I became a better programmer after that. And even
though neither the customer service person nor the programmer understood
how basic of a problem I was having, I have always been grateful for how
far out of their way those two people went to help a 14 year old kid.
By the way, it wasn't until a few days after the conversation
that it dawned on me that I had /talked to the programmer of the BASIC
Programming Language [2600] cart!!/
Years later, when I re-purchased a bunch of 2600 stuff, I got the
BASIC Progamming cart. I was amazed at how good a teaching tool it was,
considering the platform it was running on. You have all kinds of tools
at your disposal there. Quite a feat, considering the limitations of the
2600.

Gee - I hate to burst your bubble, but as far as I know there is no way the
Atari can *read* a CD-ROM - you *need* a PC.

APE is inexpensive, and a SIO2PC cable is ridiculously easy to make.

What is the problem?

cooley@nevada.edu (DEBORAH COOLEY) wrote:

DC> So what you are saying is that when I take the file that is perfect
DC> on my Atari, transfer it to my PC using SR [ed: Sparta Read], then
DC> SR changes it to ATASCII format? OK, I'll try UMich.... Thanks

The problem is that Sparta-Read doesn't do --ANYTHING-- to the text file. It --LEAVES-- it in ATASCII text records. ATASCII (ATARI ASCII) uses a character code of 155 (decimal), also known as a "high ASCII" ESCAPE character, i.e. an <ESCAPE> with the high-bit turned on, i.e. 27+128=155, as a textual END-OF-LINE marker. UNIXes and AMIGA-DOS use a LINE-FEED character code of 10 (decimal) as a textual END-OF-LINE marker. MS-DOS uses a CARRIAGE-RETURN, LINE-FEED character code pair of 13 (decimal) and 10 (decimal) as a textual END-OF-LINE marker (CONTROL-M, CONTROL-J).

Sparta Read doesn't change the 155's at the end of each line, so they show up as Cent Signs. What you need to do is to edit your ATARI end-of-lines so that the ATASCII CARRIAGE-RETURNs are replaced with the ATARI graphics shapes for CONTROL-M and CONTROL-J. This should look like a "snow plow" or a "choo-choo", e.g. -\ and there should be no ATASCII CARRIAGE RETURNs between them, so that the sentences "run on" without a break, such as:
-\Hello there,-\ How are you?-\I'm OK.-\Are you OK?-\ Winston-\

...on the ATARI would read...

Hello there,
How are you?
I'm OK.
Are you OK?
Winston

...on your IBM PC.

Many IBM PC text editors will allow you to "search and replace" edit the Cent Sign by holding down the ALT key and typing 155 and releasing the ALT key. [See "How to enter a character code from the keyboard" in your IBM PC manual.] If you are on a UNIX system, you can translate character codes directly by using the shell command "TR" [See "man tr".] The terminal program BOBTERM for the ATARI 8-bit, will perform ATASCII translation automatically when you hold down the shift key when doing a "select transfer method". Thus, a modem-to-modem connection of your ATARI to your IBM PC via BOBTERM would allow you to send untranslated XMODEM data by entering a "4", but would allow you to send translated XMODEM text by entering a "$". Also, the ATARI text editor TEXTPRO will allow you to edit

ATASCII carriage returns into ASCII CONTROL-M, CONTROL-J snow ploughs.

(I believe that XEDIT, EMACS, and VI can also edit character codes directly
with a little persuading, i.e. "verbose literal quote character code on".)

Good Luck!

Mark's right about you have to start with a PC, so that end is taken care of. He's also right about sio2pc cable since last time I checked my parts list, a fully enclosed 1489 version of the cable is less then $9 in parts at Radio Shack. If you really wanted to go Atari as much as possible, IMHO; the way to got would be an 8 bit hooked up to a cheap PC with a sio2pc cable running APE since it gives better performance. Even then you would run into some problems, number of files in a Atari directory for instance. That's what makes a MS DOS file/hard drive server a good idea.
I haven't done it yet(& probably won't find the time in the next year!) but I'm 90% sure you could convert .ATRs to double density Atari disks & 95% sure you could do the same with .XFDs! People with PCs should really give ANADISK & DEANA.COM if they want to go the other way, real Atari disk to .XFD. It works perfectly for me with double density disks.

Watch for the Atari 8-bit Vendors List in this newsgroup. You can
connect the ECI interface with a Black Box from CSS, an old ICD MIO (if you
can find one), or the new FTE MIO II (if/when it's finally released).
The MIO II works with IDE hard drives; the other interfaces work with
SCSI drives or a SCSI-to-MFM adapter card.

: >ready" CD-ROM for use on a BBS so 8bit users can use the disk. FORCING
: >8bit users to need an ST or IBM to decode the software is rather

: Gee - I hate to burst your bubble, but as far as I know there is no way the
: Atari can *read* a CD-ROM - you *need* a PC.

Note the words above "BBS ready". That should explain what I was talking
about. About *need*ing a PC, I was talking about decoded the files, not
running a CD ROM. It's dumb to have to decode something that shouldn't
need to be decoded in the first place! Encoding on a PC is easy.
Decoding on an Atari 8-bit is IMPOSSIBLE! So, the designers of the CD
have EXCLUDED 8-bit users from using 8-bit disks. Rather short-sighted,
I think. Hopefully they will think about this when they do a second run.

: APE is inexpensive, and a SIO2PC cable is ridiculously easy to make.

How inexpensive? How can you assume what I can or cannot afford. You
don't know me. You also assume that I could do a electronics project.
Again, you don't know me. And you assume I have a PC, when I do not.
A lot of assuming going on here.

: What is the problem?

People who answer messages without really reading them.

: Statz

> please reply..thanks

What kind of an interface are you using?

If you have a PR or 850 interface, your stuck with the handlers that are
downloaded from the firmware in those devices.

If your using a R:verter type device, I suggest you try the bobverter handler
that comes with the bobterm distribution, its much faster internally
than the older r:verter code.

I havent used IceT for quite awhile, since it was being beta tested, so your
problem may be that IceT itself cant handle over 4800 bps, but thats
doubtful since I recall it having a nice buffering system.

Also, if you have a PC, APE provides easy access to your PC modem @ 38.4K
without any drop outs, provided your terminal program is fast enough
to handle it. (Hardware flow control is provided even it it is not).

Steve

Yup... that sounds like Sparta-DOS to me. Unfortunately I can't help
you, as I use MyDOS on floppies. MyDOS uses hard sector links rather than
a sector bitmap. I have been told by Sparta-DOS groupies on the FidoNET
who use ATARI 1050s exclusively that what you have done is "impossible"
under normal circumstances. They say that what you have done is the result
of "operator error" and "hardware failure". Just out of curiosity, have
you been using the DOS commands directly, or have you been sticking with
the DOS menus and utilities such as XMENU and XCOPY ? I have yet to use
a Sparta-DOS recovery utility and wonder what it is like (if it is easy
or difficult). I suppose that it isn't necessarily more difficult than
trying to recover an MS-DOS FAT (File Allocation Table) and disk map that
have gone bad. At least you don't have ten thousand viruses to worry about
with the ATARI. Sorry that I can't be of more help, but let us all know
how the recovery of your hard drive goes. I'm curious to know how involved
the procedure is....

CONRADUS@plearn.edu.pl (KMK)
of the Warsaw University Computing Centre, Warszawa, wrote:

1) All DOSes we tested, i.e. SpartaDOS 3.2g, SpartaDOS X 4.20,
MyDOS 4.53 and BWDOS 1.10, when they have been executed, seem to
""""""""""
force the DUNIT (\2330301) value to \23301. Such action is not
necessary, because the DUNIT is already set by the XL OS's RESET
routines, and is obnoxious, because, as a result, the DOS is
unable to read its config files, when the system has been started
from a partition other, than D1:.

Just out of curiosity, isn't MyDOS 4.53 the version of MyDOS with the short
sector numbers so that NOTE and POINT will work with ATARI BASIC ?

Isn't MyDOS 4.54 known as the "hard drive" MyDOS because of the use of
larger sector numbers ?

Does this make any difference ?

Thanks

4493. HD interface for 800?

Is there an interface which would directly connect an Atari 800 to an
IDE or SCSI hard drive? I've got about 250 games on 88k floppies which
I'd love to transfer over.

Is there a ready source for current Atari 8-bit hardware value/pricing. I am gathering together my 8-bit material for sale purposes and am interested in what the current price range should be. While my list is not yet complete, it will include the following foir sure:

Atari 800 48K w/PS
Atari 1200XL 64K w/PS
Atari 1050 Disk Drive w/PS
Atari 410 Program Recorder
Atari 810 Drive (not working , but with spares from Happy conversion)
Atari 1027 Printer w/PS
Star NX-1000 Printer

Plus some cartridges, games, etc. It will take a while to get it all together, but the main items are listed above. I want to sell ALL as one complete package. Thanks!

howdy. I have recovered some of the files, and it will be a time
consuming process. I use DISKRx to find the bitmaps of each file and have
to recover em that way. I don't know how i figured out how to do it, but
it sure surprised me how easy it is, yet time consuming when you're
looking at 400+ files.. will let ya know when i finally get everything
recovered. Then i can go thru the somewhat long process of reformatting
the drive, and can be glad that everything willbe alright as i had
recovered everything..thanks again for the reply...

I think it's 4.53/3 and 4.53/4 that you're thinking of. Right?

So, how does this baby compare to FTe's MIO II??? :)

Russ; it is still pretty much roll your own, unless you want to part with
a lot of bucks.
Used MIOs sell for about $100 even w/o a drive & a Black Box will run you
about $200. What has become the favorite work around is to just buy a
cheap clone & build an SIO2PC cable. I've bought complete 8088 based clones
complete with hard drive & monitor for $40 & ATs are only about $30 more.
If you already have a pc you can use for storage, you can get off for as
little as $10 or so + the registrations fees for the shareware of course.
Email me if you want the plans.
Rick

Gee Winston, I didn't think there were any SD users on Fidonet, only bashers.
Anyway, I was fooling around with SD the other day & I decided to push it.
Just formated a 720k disk with the specs for a 8" DSDD drive on my ATR8000.
What I did was just write 25k files to the disk until I got errors. Sure
enough, the disk filled & puked.

All the files were just "TTT...T" 255 bytes worth + EOL written what<?> 100
times. I pull out a sector editor & low & behold, there's a bunch of 'Ts
in the first sector. I was under the impression that the first sector is
only to be used for things like disk I.D., Directory sector, ... looks like
I'll have to break out my manual<sigh> but anyway.
If you have a sector editor, could you get a dump of the first sector of the
HD? Probably not the problem, but I have had disk go south on me where all
I had to do was copy the 1st sector from a good disk to the one that lost
its wits. BTW: MyDOS has bugs also, which is why I guess people like
B & C are still fans of stuff like Top DOS.
Anyway, if you can get the first sector, that may have enough info to figure
out what went wrong.
Rick

I have had experience with something similar called "the Pill" which
basically was a cartridge with a switch you needed to flip at a certain
point. This was many years ago using software borrowed from a friend...
